The living and economic situation of migrants from Ukraine in Poland in 2025

Survey report

The living and economic situation of migrants from Ukraine in Poland in 2025

Survey report

Prepared by:

Department of Statistics

Authors:

Beata Dudek (Introduction, Chapters 1.1, 3 and 5)

Paweł Strzelecki (Chapter 1.2, 2, 4)

Chapter 6 of the report was written under the leadership of Beata Dudek in cooperation with Paweł Strzelecki and authors from NBP Regional Branches:

in Lublin (Jakub Mroczek, Marek Momot)

in Rzeszów (Beata Bojda, Małgorzata Pałka)

in Poznań (Kinga Paszkiewicz, Piotr Kędziora)

in Wrocław (Kamila Miśkiewicz, Filip Munko).

The nationwide survey was conducted thanks to the involvement of the staff of the NBP Regional Branches. They included, in particular, the following: Kinga Banyś-Stalmaska, Katarzyna Będkowska-Adamiec, Elżbieta Czorek, Anna Dyksa, Jolanta Filipowska, Artur Gajda, Krzysztof Gierek, Robert Goch, Marek Grygorowicz, Marek Jackowicz, Dawid Karwat, Tomasz Kasperowicz, Piotr Kędziora, Joanna Krzysztof, Renata Kwiatkowska, Robert Leszczyński, Michał Lustrynowicz, Agata Łukasiewicz, Diana Łukaszek-Rozpendowska, Kamila Miśkiewicz, Marek Momot, Magdalena Morońska, Iwona Motylska, Jakub Mroczek, Marta Mulawa, Filip Munko, Iwona Nawrot-Szczepanik, Paweł Oktaba, Bartosz Oliwa, Małgorzata Pałka, Kinga Paszkiewicz, Jolanta Pawlińska, Grażyna Rodak, Justyna Rogowska, Wioletta Stańczyk, Patryk Strzałkowski, Adam Tochmański, Anna Tomska-Iwanow, Iwona Zadrozna, Marta Zaorska, Krystyna Złamaniec.

The Director of the Department of Statistics and the authors of this Report would like to thank public administration institutions, social organisations and other institutional entities for their assistance in obtaining respondents for the survey.

Summary

This Report presents results of the survey conducted among Ukrainian immigrants between 7 April and 20 June 2025. The key findings of the survey are as follows:

1. **The level of social and economic integration of immigrants from Ukraine is increasing.** This is manifested by the better knowledge of the Polish language by the immigrants, their becoming more independent in terms of housing, an improvement in their situation on the labour market, their living mainly on income earned working in Poland and having a network of contacts among Poles.
2. **Earned income is the primary source of subsistence for immigrants from Ukraine.** In the income structure of pre-war immigrants, earned income accounts for 92% and in the income structure of refugees - for 78%. As in previous years, remittances from Ukraine and Polish social benefits, primarily from the 800+ programme, supplement the earned income.
3. **The situation of refugees on the Polish labour market is systematically improving.** Compared to the situation a year ago, a higher percentage of refugees are in stable employment and unemployment is also lower than in the previous year. Immigrants from Ukraine are also less commonly employed as unskilled workers. On average, the labour market situation of pre-war immigrants is much better than that of people who came to Poland after the outbreak of the full-scale war.
4. **The majority (81%) of immigrants satisfy their own housing needs independently.** They mainly rent (72%) or buy their own dwelling (9%). The number of people living in collective accommodation for refugees has decreased. Over 60% of the people there are over 45 years old.
5. **A factor facilitating integration is knowledge of the Polish language, improving from year to year.** In this year's survey, 63% of respondents declared good or fluent knowledge of Polish, with only 4% declaring no knowledge of the language. Among pre-war immigrants, the level of knowledge of Polish is even higher. Over 82% declare good (49%) or fluent (34%) knowledge of the Polish language.
6. **Integration is facilitated by building relationships between immigrants from Ukraine and Poles.** In the case of 73% of immigrants, there is at least one person among Poles whom they can ask for advice on difficult matters. As far as pre-war immigrants are concerned, the percentage is higher, reaching 81%.
7. **The integration process is the most difficult for the oldest people (aged over 60).** This is manifested by a poorer knowledge of the Polish language, fewer acquaintances among Poles and the fact that a higher percentage of them are staying in organised accommodation for refugees.

8. **As in the previous years, the majority of immigrants from Ukraine are women(57%).** The average age in both gender groups of immigrants is 40. However, refugee migration is characterised by a higher percentage of the youngest, 18–26-year-olds (22%), and the oldest, over 60 (12%), than the pre-war migration, where these percentages amount to 16% and 5%, respectively. Relative to the Polish population, Ukrainian migration is characterised by a higher share of 18–26-year-olds and a lower percentage of people aged over 60.
9. **The percentage of Ukrainian immigrants staying in Poland with their life partners is increasing.** More and more pre-war immigrants are staying in Poland with their children. On the other hand, among refugees, the share of families with children staying in Poland is slightly decreasing. Male refugees residing in Poland are, on average, younger than female refugees and they are less likely to have immediate family in Poland and, if they are staying with a partner, they often have no children in Poland.
10. **The position of Ukrainian refugees on the Polish labour market is improving.** Compared to 2024, the unemployment rate among refugees has decreased and the percentage of people declaring that they have a permanent job in Poland has increased. The percentage of immigrants employed as unskilled workers has also decreased in favour of jobs requiring at least basic skills.
11. **In 2025, approximately 36% of refugees and 25% of pre-war immigrants said that they were working in Poland below their qualifications.** Underemployment mainly affects male and female refugees who have been unable to find employment other than as unskilled workers. On the other hand, the share of refugees who found a job similar to their job in Ukraine or retrained and do not rate the new job as inferior has increased significantly over the last three years (from 34% to 50%). The problem of underemployment affects women more often and increases with age and experience of working in Ukraine acquired before arrival in Poland. People employed in the smallest companies in Poland are also more likely to declare working below their qualifications.
12. **The average wage of migrants from Ukraine grew at a rate similar to that observed in the economy as a whole.** Due to the demand for labour, it remains most profitable for immigrants to work in industries dominated by men: IT, construction and transport. The gap between the average wages of men and women is much larger among immigrants than in the rest of the Polish economy.
13. **Immigrants continue to support their relatives in Ukraine financially, but a downward trend is observed in terms of frequency and amount of remittance.** Overall, 43% of immigrants remit money to Ukraine, pre-war immigrants more often (55%) than refugees (36%). As in previous years, remittances are mostly to immediate family members. 28% of respondents transferring money made remittances for the army.
14. **Immigrants' declarations concerning their further residence plans have not changed significantly over the last two years.** In 2025, 51% of pre-war immigrants and 24% of

refugees would like to stay in Poland permanently, but 56% of refugees and 37% of pre-war immigrants had no specific plans. On average, people who spoke Polish better, those with immediate family in Poland and male immigrants more often declare their intention to stay in Poland. The potential extension of stay in Poland is mainly related to the possibility of supporting the family and working in Poland. Other factors, including the potential conclusion of peace, are less important for short-term decisions.

15. **Refugees continue to come to Poland, although in smaller numbers.** Refugees of the 2024-2025 wave¹ differ from 2022 refugees in terms of gender (higher percentage of men), age structure (higher share of 18–26-year-olds) and family situation (fewer of them are staying in Poland with children, more with a partner or alone). However, what they have in common with refugees of the 2022 wave is poorer knowledge of the Polish language and a more difficult situation on the labour market compared to pre-war immigrants. Among the refugees of the 2024-2025 wave, there is a high percentage of people without clear plans for the future, who came to Poland to wait out the war.
16. **According to the available register data, the largest numbers of immigrants from Ukraine live in the Dolnośląskie and Mazowieckie Voivodeships.** They account for the highest percentage of immigrants in relation to the total population in these voivodeships (approximately 6%). In the voivodeships of eastern Poland (Podlaskie, Lubelskie, Podkarpackie), the number of immigrants from Ukraine and their share in the total number of inhabitants of the voivodeships are significantly lower (2%).
17. **The labour market situation varies regionally.** Most economically inactive immigrants, i.e. not working and not searching for work, are staying in the voivodeships of eastern and south-eastern Poland. This fact can be explained by the proximity to the border and home. On the other hand, permanent jobs, which are a more stable form of employment, are more likely to be held by immigrants living in the voivodeships of western Poland.
18. **Facilitating the legalisation of residence is the most important need for immigrants reported in all voivodeships except for Lubelskie.** A significantly higher percentage of respondents indicate that it is easier to legalise their residence in the western voivodeships of Poland, most frequently in the Dolnośląskie voivodeship. On the other hand, in the Lubelskie voivodeship, with the highest percentage of immigrants searching for work, the primary need is assistance in finding employment.
19. **The highest percentage of immigrants tying their plans to Poland for the long term resides in the voivodeship of western Poland, such as Lubuskie, Dolnośląskie and Opolskie, and additionally in the Łódzkie voivodeship.** On the contrary, immigrants residing in the Kujawsko-Pomorskie and Śląskie voivodeships are least likely to have such plans.

¹ Refugees of 2024-2025 wave are those who arrived in Poland between 2024 and 2025 (until June 2025).

20. **The report takes a closer look at the developments specific to individual voivodeships, summarised in the sections below:**
- 20.1. **Ukrainian students account for the largest group among foreign students in Poland. In the Lubelskie Voivodeship, they account for 8% of the total number of immigrants from Ukraine.** The highest percentage of them comes from western Ukraine, while the most frequently indicated need is assistance in finding a job. Approximately half of them plan a longer stay in Poland.
- 20.2. **Podkarpackie is the voivodeship through which most of the approximately one million refugees currently staying in Poland transited.** However, according to available register data, only 30 thousand refugees were staying in the Podkarpacie region. Among them, immigrants from western Ukraine are the largest group who, due to their proximity to the border and home, keep more frequent contact with people staying in Ukraine.
- 20.3. **The Dolnośląskie Voivodeship is inhabited by a large Ukrainian community, whose share in the voivodeship population is the highest in Poland.** An important part of this community had already been staying in the Dolnośląskie Voivodeship before the outbreak of full-scale war in Ukraine. The group is characterised by stable employment, a marginal percentage of non-working people, a good knowledge of the Polish language, a settled housing situation and a high percentage of people declaring their intention to stay in Poland permanently or for more than a year. The most important need reported by immigrants in the Dolnośląskie Voivodeship is easier legalisation of their stay.
- 20.4. **Wielkopolskie is the voivodeship with the lowest unemployment rate in Poland and immigration from Ukraine is an important supplement to labour market shortages.** Almost half of the immigrants work in occupations which there is a greatest shortage of in Wielkopolskie. Others supplement the shortages mainly in trade and in the personal service sector. A significant part of these jobs requires tertiary education or specialised qualifications.

Introduction

This Report summarises a survey conducted among migrants from Ukraine between 7 April 2025 and 20 June 2025 in all voivodeships of Poland. Narodowy Bank Polski began conducting surveys of migrants from Ukraine in 2015, following the emergence of larger-scale migration from Ukraine, and due to its impact on the Polish labour market and balance of payments. In its current format, the survey has been conducted annually since 2022. The aim of this year's survey, as last year, was to diagnose the economic and living situation of immigrants more than three years after the outbreak of the full-scale war, including, in particular, the assessment of their economic activity and income situation. In addition, it is still important to attempt to assess whether migration from Ukraine is permanent or temporary, and to track the scale and characteristics of remittances from Poland to Ukraine. In the current edition of the study, it was decided to conduct an in-depth analysis of the situation of migrants from Ukraine by voivodeship, on the one hand, to present more extensive information on selected issues in this arrangement and, on the other hand, to portray the characteristics of certain voivodeships. Selected issues specific to the Dolnośląskie, Lubelskie, Podkarpackie and Wielkopolskie Voivodeships were analysed. The Lubelskie Voivodeship was analysed in terms of migration to a border academic centre; the Podkarpackie Voivodeship as an example of a border voivodeship with dynamic migration flows; and the Dolnośląskie Voivodeship as a voivodeship with permanent migration. The Wielkopolskie Voivodeship, on the other hand - from the point of view of migration from Ukraine as a replenishment to labour market shortages.

The migration to Poland from Ukraine started intensifying in 2014. Initially, it was triggered mainly by economic issues,² i.e. the difference between salaries in Poland and Ukraine, and Polish regulations allowing Ukrainian immigrants to work in Poland. Among the non-economic motives, Russia's attack on Ukraine in 2014 was of primary importance (annexation of Crimea, the attack on Donbas). At the beginning, the Ukrainian migration was predominantly of a circular nature. Over time it has become more permanent. This change was triggered primarily by the COVID-19 pandemic and by the Russia's attack on Ukraine in 2022 marking the outbreak of a full-scale war. According to the publicly available data from the PESEL UKR registers,³ approximately one million immigrants who arrived in Poland after the outbreak of the war in 2022, reside in Poland. The largest influx of refugees was recorded in 2022. A total of almost 1.5 million PESEL UKR applications were registered then. Some of those people left Poland, but new refugees arrived. As at 1 September 2025, a total of 1,950 thousand applications had been registered. The group of approximately one million refugees residing in Poland

² *Ukrainian citizens working in Poland - report from the survey. The survey conducted in 2015*, Iza Chmielewska., Grzegorz Dobroczyk, Jan Puzynkiewicz, Narodowy Bank Polski, Warsaw, p. 12.

³ PESEL UKR register - a register of Ukrainian citizens and their family members who have been granted the so-called UKR status pursuant to the specific Law of 12 March 2022 on assistance to Ukrainian citizens in connection with the armed conflict on the territory of the country.

in 2025 includes around 660 thousand of adults, aged 18 and over (Figure 1). Data on the number of valid residence permits primarily for the so-called pre-war immigrants, published by the Office for Foreigners (UdSC), on the other hand, indicate that after a strong increase in the number of valid residence permits between 2021 and 2024, the situation has stabilised, and the increases are no longer as dynamic. In July 2025, 541 thousand people had valid residence permits (Figure 2).

According to the ZUS [Social Insurance Institution] data, slightly over 818 thousand Ukrainian immigrants worked in Poland at the end of June 2025. This was the largest group of foreigners working in Poland (approximately 66% of the total number of working foreigners).⁴

Figure 1. Number of immigrants from Ukraine in the PESEL-UKR Register⁵

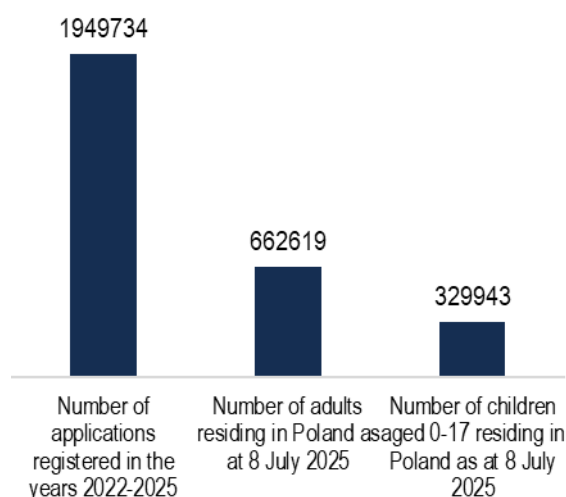

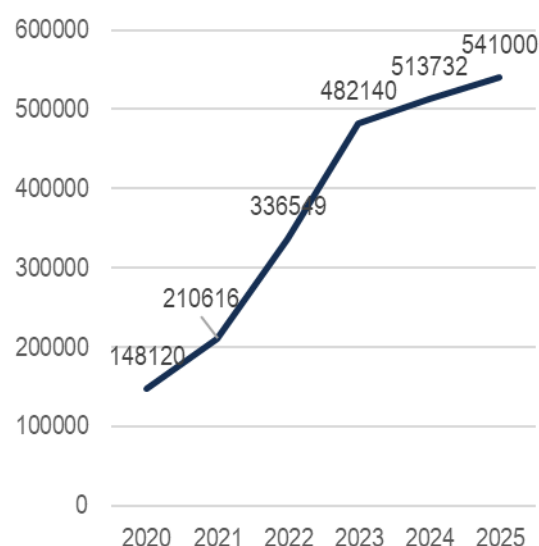

Figure 2. Number of valid residence permits issued to migrants from Ukraine in 2020-2025⁶

Surveys conducted by Narodowy Bank Polski make it possible to expand the knowledge on immigrants from Ukraine, in terms of both their socio-demographic characteristics and economic conditions. The surveys make a distinction between pre-war immigrants, i.e. people who have migration experience in Poland before 2022, and refugees - people who found themselves in Poland due to the outbreak of war in 2022. Immigrants or total immigrants in the Report mean as pre-war immigrants and refugees combined. The Report presented includes references to four previous NBP surveys. The first was conducted among refugees between

⁶ Migracje.gov.pl – UdSC, Maps and Statistics of immigrants and migration services in Poland.

April and May 2022. The next three, which covered both pre-war immigrants and refugees, took place in the periods: from September to November 2022, from May to July 2023 and from April to June 2024.

1. Socio-demographic characteristics of immigrants from Ukraine

1.1. Basic characteristics of immigrants

Women account for the majority of Ukrainian immigrants, with their prevalence increasing in older age groups. 57% of Ukrainian immigrants are female and 43% are male (Figure 3). In the case of adult Poles, the ratio is 52% of women against 48% of men. Women clearly predominate among refugees , as in previous years.⁷ They prevail in older age groups of the total immigrant population. In younger age groups (up to 34 years of age), similar proportions of women and men were observed (Figure 4).

Figure 3. Gender structure⁸

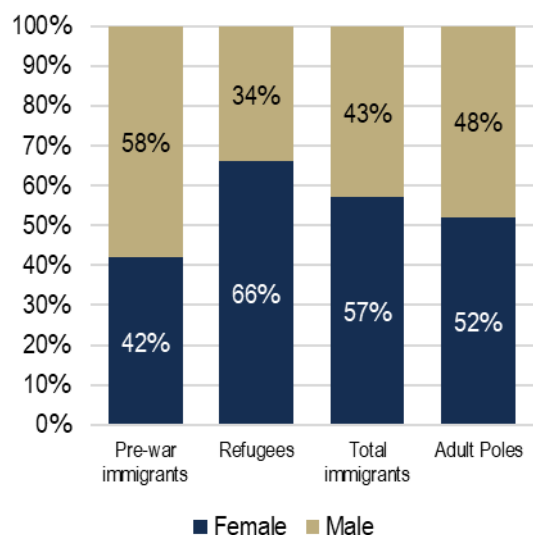

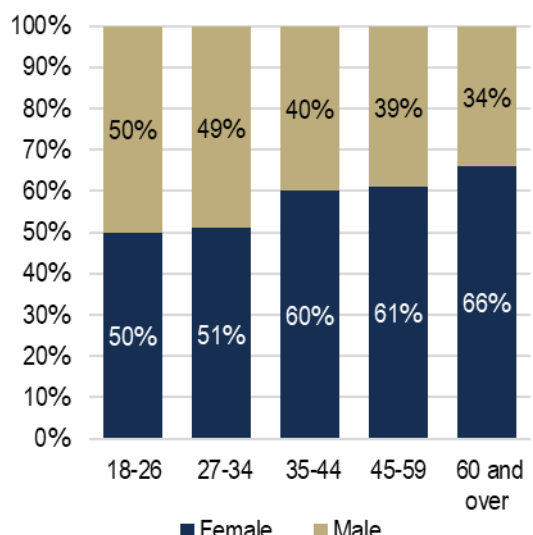

Figure 4. Gender structure by age of respondents (total immigrants)

As in 2024, persons aged 35-44 represent the largest group of immigrants (Figure 5). The average age of pre-war immigrants and refugees is similar at around 40 years. At the same time, the age structure of both immigrant groups differs. Among refugees, there are noticeably more youngest (18-26 years old) and oldest (over 60 years old) people than among pre-war migrants, which is related to the wartime and the non-profit nature of this migration (Figure 6). On the other hand, comparing the age structure of adult immigrants from Ukraine and adult Poles,

⁷ A methodological change has been introduced in relation to 2022-2024. Data from the 2025 survey were further re-weighted by gender on the basis of residence registers (PESEL UKR register and UdSC register).
⁸ Data concerning adult Poles: Statistics Poland, Population by gender and age as at 31 December 2024.

there are significantly more 18-26-year-olds (17% vs. 9%) and fewer people over 60 (10% vs. 19%) among immigrants from Ukraine than among Poles.

Figure 5. Age structure of immigrants compared to the age of adult Poles

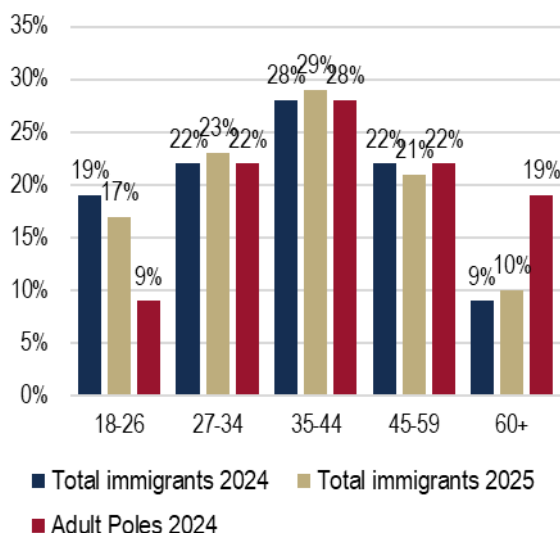

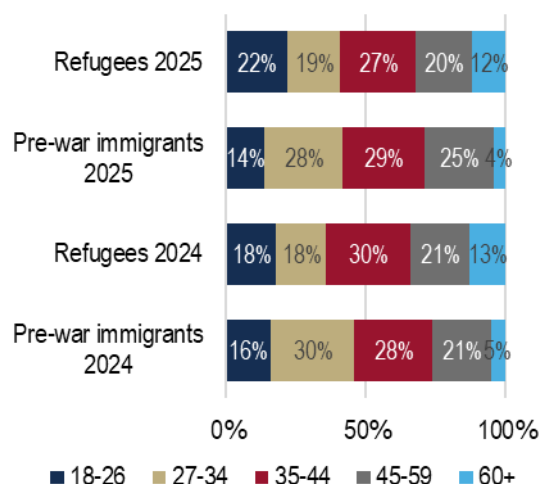

Figure 6. Age structure of immigrants broken down by pre-war immigrants and refugees

Immigrants come from all regions of Ukraine. No significant changes were recorded compared to the previous year in terms of regions of immigrants' origin.

As in the previous years, the most numerous group of Ukrainian immigrants are those originating from western Ukraine (25%), whose predominance in terms of numbers is noticeable mainly among pre-war immigrants (Figure 7). Western and Central Ukraine are the regions from which most Ukrainian citizens arrived to work in Poland before the outbreak of the full-scale war. The least numerous group are immigrants coming from Kyiv and Eastern Ukraine (13% and 14% of the total, respectively). However, it should be noted that noticeably more refugees than pre-war immigrants originate from these regions of Ukraine, which is the result of the outbreak of war and the flight of many people from the battlefields.

Most immigrants are well-educated, with a university degree or secondary education (Figure 8). Women are more likely than men to have tertiary education (48% vs. 35%) (Figure 9). More pre-war immigrants than refugees have secondary vocational education, which may be related to the originally labour-intensive nature of this migration. A downward trend is recorded in the percentage of people with primary, vocational education (refugees: in 2022 - 20%, in 2023 - 18%, in 2024 - 13%, in 2025 - 7%; pre-war immigrants: in 2022 - 17%, in 2023 - 23%, in 2024 - 11%, in 2025 - 6%). On the other hand, there is an increase in the percentage of people with secondary education (from 41% in both immigrant groups in 2024 to 50% among refugees

and 52% among pre-war immigrants in 2025).⁹ In the case of refugees, this is associated with the influx of successive waves of refugees, among whom the percentage of persons with secondary education is significantly higher.

Figure 7. Regions of origin of immigrants from Ukraine

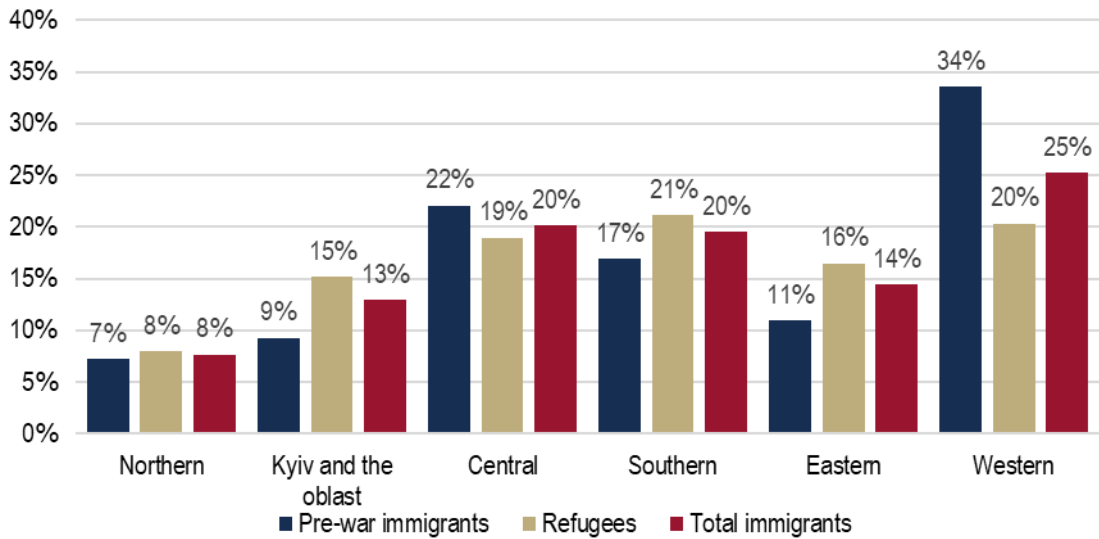

Figure 8. Education of immigrants

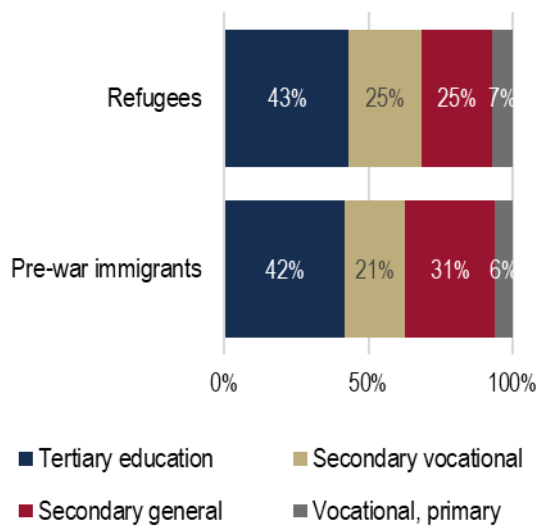

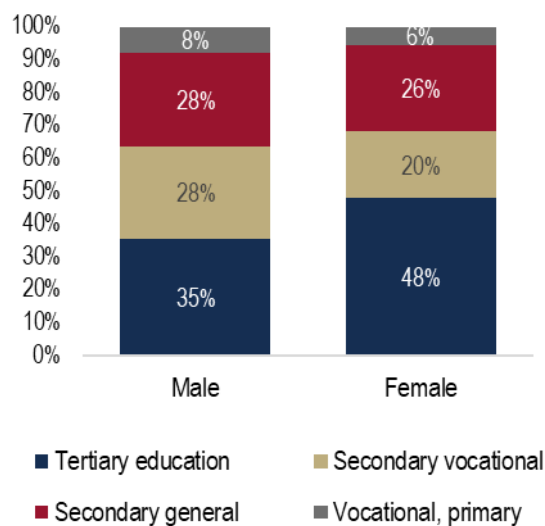

Figure 9. Immigrant education and gender

⁹ The change in the way the results are weighted in 2025 affects, to a certain extent, the results of the survey on the education of pre-war immigrants. Men are more likely than women to have secondary or secondary vocational education. Therefore, indications in this type of education are higher. With regard to primary vocational education, no significant gender differences were noted.

The level of Polish language knowledge among all immigrants is increasing year by year, but it is still higher among pre-war immigrants (Figure 10, 11). This is even more important as new refugees are still arriving, among whom the level of knowledge of the Polish language is lower.

Less than 4% of respondents said that they did not speak any Polish , while 32% assessed that they knew a little Polish. The remaining respondents declared good or fluent Polish. The 2025 survey is the first one that contains a question about fluency in Polish. Overall, 22% of respondents assessed that their Polish language skills were at the fluency level, including 34% of pre-war immigrants and 14% of refugees.

Figure 10. Knowledge of the Polish language among pre-war immigrants from Ukraine

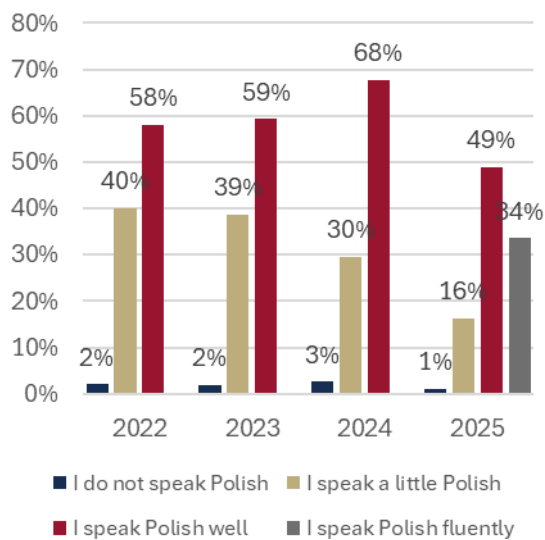

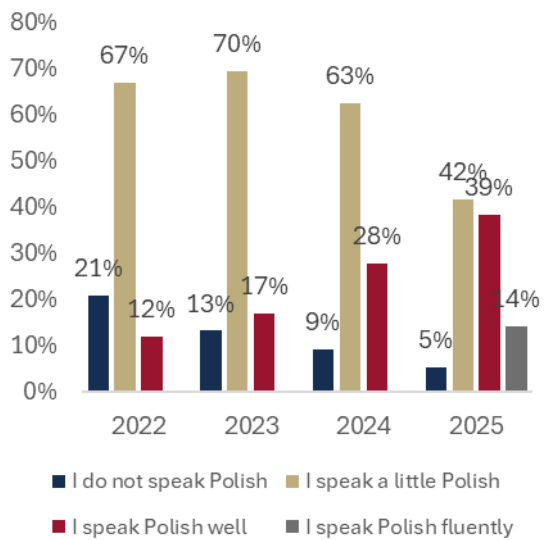

Figure 11. Knowledge of the Polish language among refugees from Ukraine

Factors that diversify immigrants in terms of language skills include age and region of origin. As the age of the respondent increases, the level of knowledge of Polish decreases (Figure 12). Among persons who declare the lack of knowledge of the Polish language, 40% are aged over 60, and they find it the most difficult to integrate in this area. In terms of the region of origin, immigrants from western Ukraine (22%), the area close to Poland, are most likely to speak Polish fluently, while those from eastern Ukraine (8%) and southern Ukraine (9%) are least likely to be fluent.

Figure 12. Level of knowledge of Polish depending on age

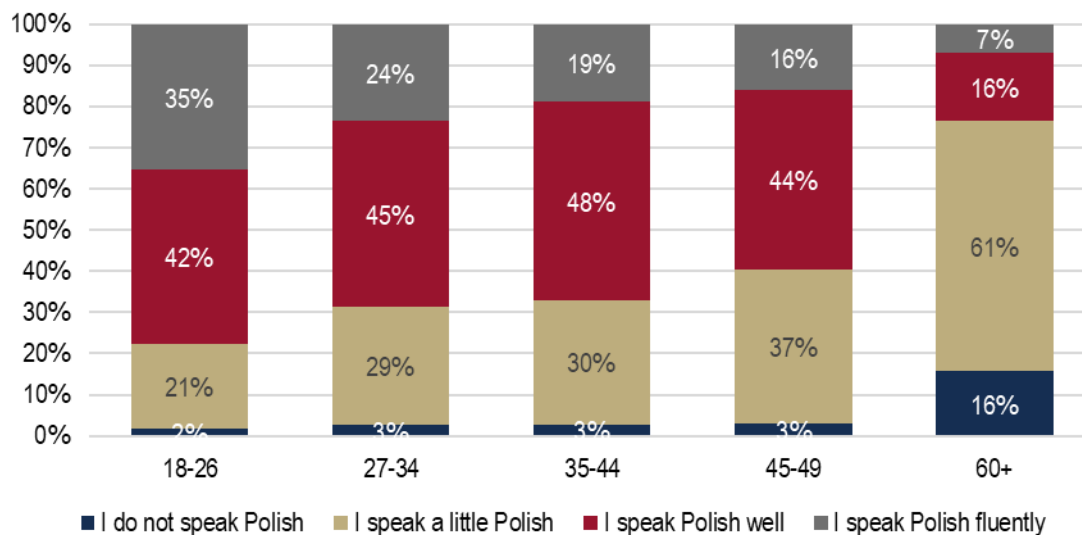

Figure 13. Structure of answers to the question: Is there somebody among your Polish acquaintances whom you can ask for advice on difficult matters?

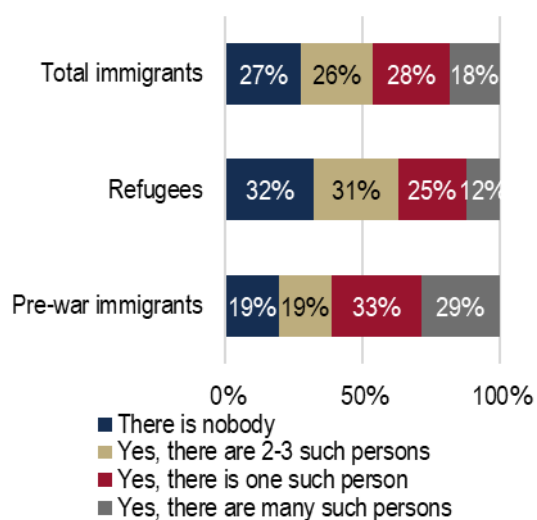

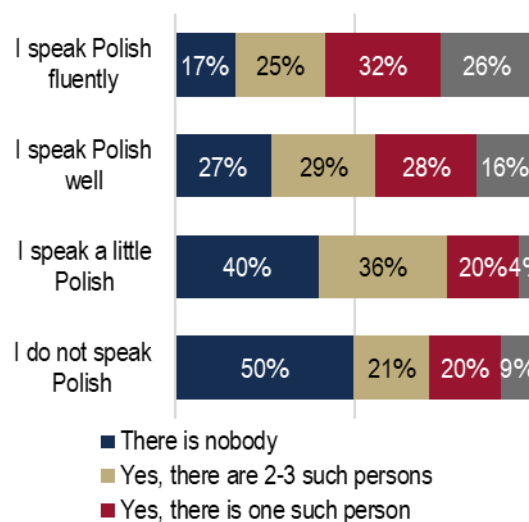

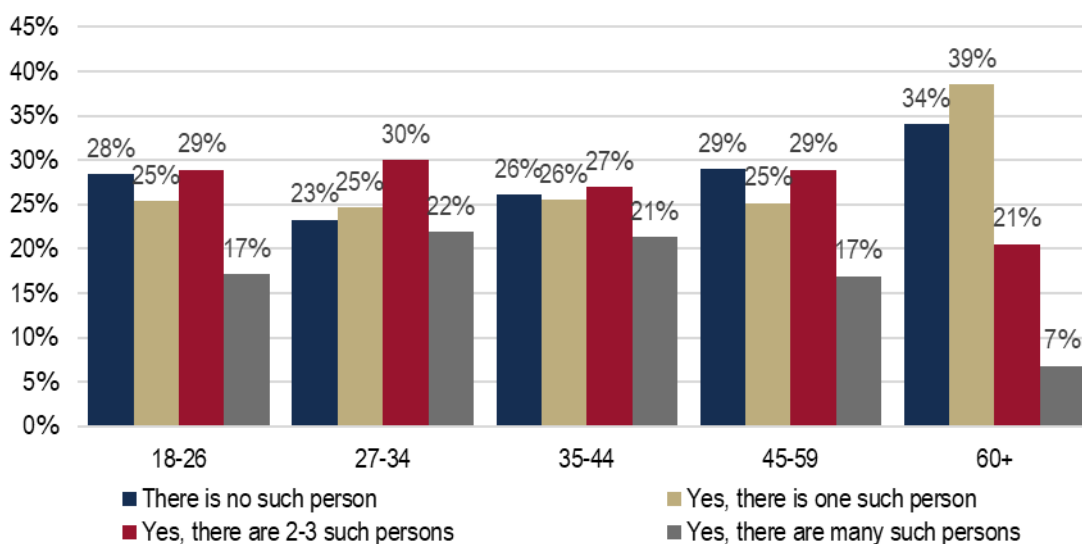

Figure 14. Knowledge of the Polish language and having Polish acquaintances who can be asked for advice

A total of 73% of immigrants responded that there was at least one person among Poles whom they could ask for advice on difficult matters. About 27% of respondents declared that there was nobody, more in the case of refugees (32%) than among pre-war immigrants (19%) (Figure 13). 18% of the total immigrant population know many such persons. Pre-war immigrants (29%) were more likely to make such declarations than refugees (12%). Knowledge of the language of the host country is one of the factors that significantly affect the social integration process of Ukrainian immigrants, including making friends among Poles. This claim is confirmed by the survey. People who are fluent (26%) and proficient (16%) in Polish tend to have more Polish acquaintances (Figure 14). Respondents who speak a little Polish or do not speak Polish at all are less likely to have acquaintances among Poles whom they can ask for advice. As the level of knowledge of the Polish language increases, so does the percentage of declared acquaintances among Poles.

Another factor affecting the level of integration is the age of respondents (Figure 15). As people get older, the percentage of people with no friends among Poles increases. An exception in this case are the youngest, 18–26-year-olds, who find it more difficult to make friends among Poles than those aged 27–44.

Figure 15. Age of the respondent vs. the level of integration, understood as having Polish acquaintances who can be asked for advice on difficult matters

1.2. Ukrainian family and children

The percentage of immigrants staying in Poland with a partner has increased significantly over the recent years, suggesting a growing sustainability of migration from Ukraine. Before the outbreak of the full-scale war in Ukraine, short-term labour migration prevailed in Poland

in 2019, while the percentage of people staying in our country with a partner was close to 38%. Among immigrants who arrived in Poland before February 2022, the share of persons living with a partner increased to 47% in 2023 and 53% in 2025 (Figure 16). Initially (in 2022), only 13% of war refugees came to Poland with a partner, but this percentage increased to 29% in 2023 and reached 35% in the years 2024-2025 (Figure 17). This trend reflects a gradual adaptation and integration of immigrants, as well as their increased propensity to settle permanently.

The structure of immigrant families in Poland is changing – fewer and fewer refugees are staying with minor children, while the share of pre-war immigrants staying in Poland with children is increasing. In 2025, 40% of refugees and about 34% of pre-war migrants were staying in Poland with minor children (Figure 17). These percentages gradually converged on one another, however, from different initial levels. An upward trend was observed among immigrants staying in Poland before the war, which slowed down slightly in 2025. In the case of refugees – as many as 65% arrived in Poland in the first half of 2022 with children (their own or those entrusted to their care). This percentage decreased to 43% in 2023 and approximately 40% in 2025. Pre-war immigrants and refugees expressed different motivation for staying in Poland. The first group came initially for work purposes, usually leaving their children in the care of family in Ukraine, and after 2022 they became highly determined to stay in Poland and an increasing number of them arranged for their family members to come to Poland. On the other hand, the purpose of refugee arrivals was most often to protect themselves and their children. Over time, some of them decided that the situation did not require their children's stay in Poland. As a result of these opposing trends, the difference between the percentages of people with children in Poland in both groups was gradually decreasing.

Among Ukrainian immigrants in Poland, full families with children are a minority. The presence of single-parent immigrant families residing in Poland is determined by traditional gender roles and the conditions of mobilisation for military service in Ukraine. Among the Ukrainian men and women staying in Poland, full families with children accounted for approximately 20%. The situation of other immigrants was diversified depending on gender. Significantly more men (Figure 18) declared that they had no relatives staying with them in Poland (27% vs. 18% for women) or, if they stayed with a life partner, they had no children at all or no children staying in Poland (27% vs. 16% for women). On the other hand, single mothers with children (23%) were much more common than single fathers with children (5%). Approximately 20% of immigrants (a slightly higher proportion of women - 22% against 19%) residing in Poland had only other family members (who were not their partners or children) in our country. Such an answer usually meant older parents. Men from Ukraine often stay in Poland without any family.

Figure 16. Changes in the percentage of family members residing in Poland - pre-war immigrants

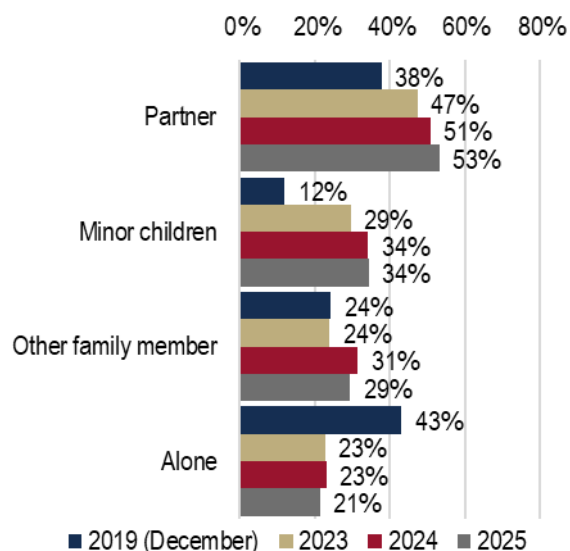

Figure 17. Changes in the percentage of family members residing in Poland - refugees

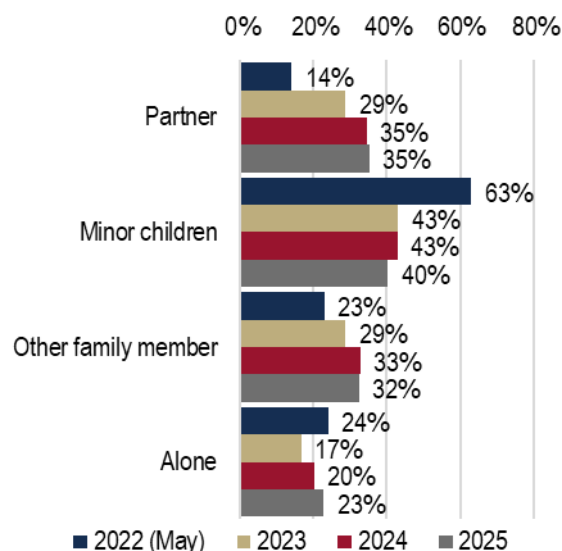

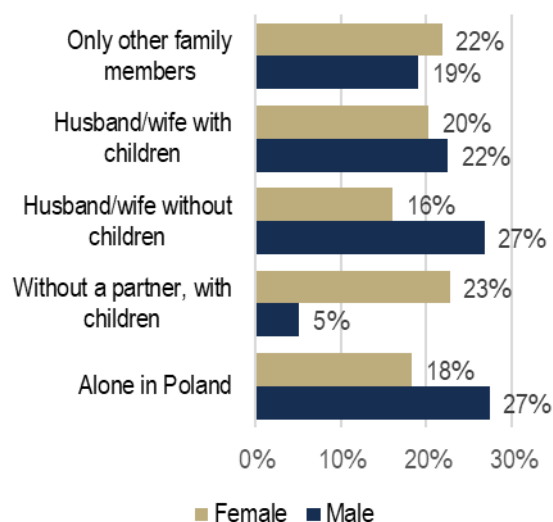

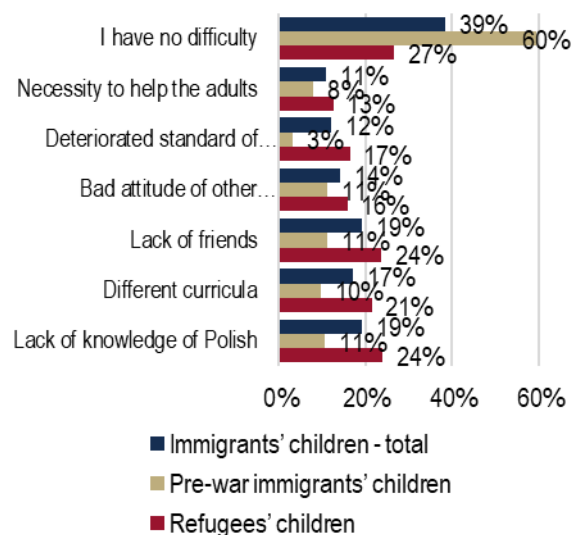

Figure 18. Family members staying in Poland, by gender*

*Answers add up to 100% separately for men and women.

Figure 19. Immigrants' opinions on the greatest difficulties faced by their children staying with them in Poland**

** Responses do not add up to 100%. More than one answer could be indicated.

A total of 60% of pre-war immigrants declare that their children in Poland do not face any difficulties. Refugee children most often have problems related to learning the Polish language and have no friends. The problems experienced by Ukrainian children in Poland mainly concern refugees - 73% of their parents declared a problem (Figure 19), 27% claimed no difficulties. The difficulties most frequently indicated were those related to insufficient knowledge of Polish (24%), lack of friends (24%) and the curriculum in Poland (21%). As it turns out, two main groups can be distinguished among the responses illustrating the difficulties most frequently reported by respondents.¹⁰ The first group is often a combination of: school-related problems: difficulties in learning Polish, the curricula in Polish schools, lack of friends or the bad attitude of other children. The second group of responses jointly selected by respondents, independently of the first group, included problems related to the deterioration of the standard of living compared to that in Ukraine and the need for children to take over adult responsibilities. Interestingly, respondents indicating the problem of children having to take over adult responsibilities rarely mentioned at the same time that their child does not speak Polish. This may reflect the fact that in many families it is the children – thanks to their knowledge of Polish – who are able to help the adults staying in Poland. Thus, the statistical analysis identified two main sources of problems for the children of Ukrainian immigrants at Polish schools: alienation associated with the necessity to attend school in a foreign country and the necessity for the children to take over some of the responsibilities of the adults, which affects their learning process at school.

¹⁰ Conclusions based on exploratory factor analysis using the principal components method.

2. Immigrants from Ukraine on the Polish labour market

2.1. Economic activity of immigrants on the Polish labour market

In 2025, the percentage of employed persons and the stability of employment of pre-war immigrants remained at a stable and high level and improved in the case of refugees. More than 90% of those who arrived in Poland before 2022 had a permanent job in Poland, were self-employed or employed on another basis: seasonally, without a formal contract or working for companies outside Poland (Figure 20). Approximately 77% of pre-war immigrants describe their employment status as permanent and this percentage has remained at a similar level since 2023. In the case of refugees (Figure 21), the percentage of those employed on a permanent basis was lower than among pre-war immigrants (54% in 2025), but this figure is rising (in 2023 it was 38%), while the share of people working under less stable contracts is decreasing (to 17% in 2025 from 26% in 2023). The relatively favourable situation on the labour market in Poland and the passage of time have contributed to a gradual improvement in the performance of refugees on this market. Over time, refugees were able to gain a better understanding of the options available to them, find more suitable jobs, and adapt their skills to the requirements of the labour market.

Among immigrants who arrived in Poland before the war, the share of self-employed has been increasing. In 2019, the percentage of self-employed workers among economic migrants from Ukraine was approximately 3%. In 2025, the share has reached 8%, reflecting its steady growth (Figure 20). An in-depth analysis of this phenomenon shows that pre-war immigrants are most often self-employed in IT or personal services (27% of persons working), construction (approx. 22%) and transport (approx. 10%). Among refugees, the share of workers declaring self-employment is low, but it is also slowly increasing and mostly relates to the same sectors as indicated by pre-war immigrants. Increasing awareness of the conditions of the Polish labour market and the entrepreneurship of immigrants are increasingly encouraging them to choose self-employment.

The labour market participation of immigrants from Ukraine remains very high. Unemployment is relatively low among earlier immigrants and remains high but is decreasing among refugees. The percentage of those economically inactive (not working and not searching for work) remains stable – among adult pre-war immigrants surveyed it was 1-2%, among refugees it reached 11-12% (Figure 20). The high labour market participation of pre-war emigrants results from the fact that those people mainly came to Poland before 2022 with the aim of getting a job. The relatively high refugee labour market participation is unique compared

to other European countries. It can be linked to the adaptation of forced immigrants to the conditions in Poland: limited access to benefits but ensured by the temporary protection of free access to work. For many refugees, finding a job work has enabled them to become economically independent despite their often-difficult personal situation. The decrease in the percentage of unemployed refugees from 25% in 2023 to 14% in 2025 is another positive trend related to the good situation on the Polish labour market and active job searching. However, the unemployment rate among refugees from Ukraine is still four times higher than among Polish citizens.

Figure 20. Changes in the labour market participation of immigrants from Ukraine who came to Poland before the outbreak of the war (2019, 2022-2025)

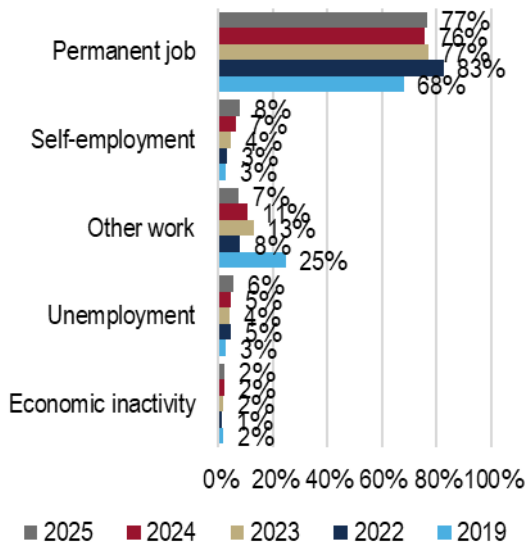

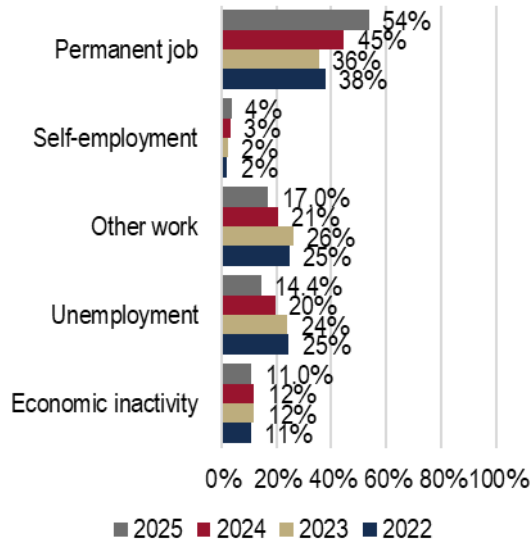

Figure 21. Changes in the labour market participation of war refugees from Ukraine (2022-2025)

2.2. Employment and wage structure of immigrants from Ukraine in Poland

The median wage of immigrants from Ukraine has markedly increased but remains clearly below the median earnings of Polish workers. In a sample of approximately 3 thousand working immigrants surveyed, the median net monthly salary was just under PLN 4,500 (Figure 22). Compared to these values, the median earnings of Polish workers amounted to approximately PLN 5,300. The differences in hourly rates are slightly higher since, on average, immigrants work longer hours than Polish citizens (42.6 hours per week). The differences between the wage rates applicable to groups of domestic and immigrant workers are typical of the relatively recent migration and may stem from a number of factors. The most important factor is the structure of professions – immigrants are more likely to work in less productive and lower paid occupations compared to Polish workers in general. Their education and

experience gained prior to their departure is also relatively insignificant for their wages, which means that in many cases they have to start their careers from scratch. However, the level of knowledge of the Polish language is of great importance.

Significant differences in immigrants' wages continue to persist depending on gender and date of arrival in Poland. The earnings of male and female refugees are clearly lower than those of the men and women who came to Poland before the war. For men, the difference between the medians¹¹ reaches 15%, for women – 10%. There is also a considerable gender pay gap. The median wages of female immigrants who arrived before 2022 are 25% lower than those of men who arrived in the same period. In turn, the median wage of female refugees is 20% lower than that of male refugees who arrived in the same period. In comparison, the difference in median net wages between men and women among Polish employees was approximately 8% in favour of men. The data indicate that immigrants’ jobs offer better pay conditions for men and for immigrants with experience or a more stable residence situation than the temporary protection.

Figure 22. Medians of net salaries of immigrants, by gender and by date of arrival in Poland

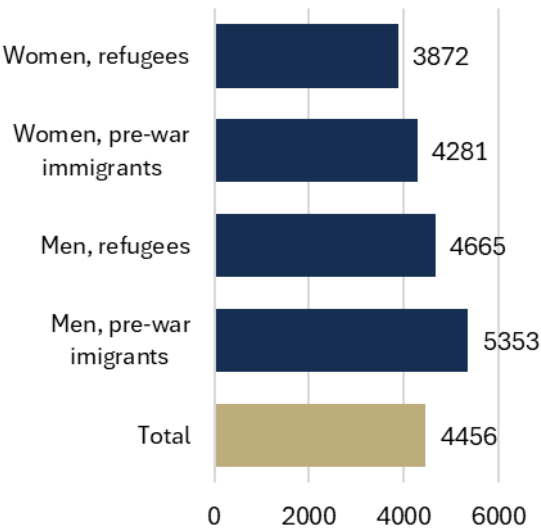

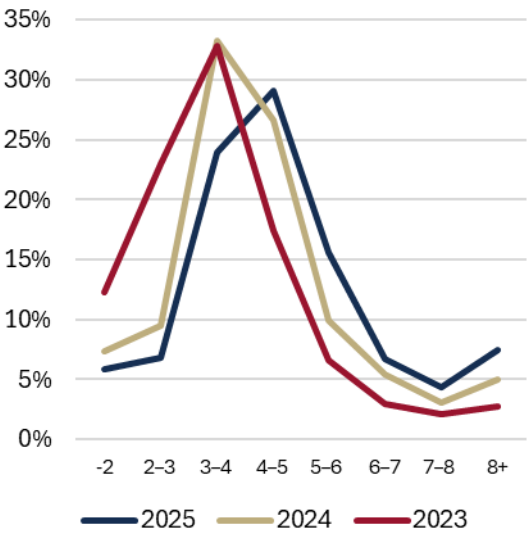

Figure 23. Distributions of responses to the question on net salaries in 2023-2025 in thousands of PLN

¹¹ Medians - the so-called middle worker's wage in each group - were used for comparisons. The advantage of these measures over the average is that they are resilient to extreme values (individuals with very high wages) and to the asymmetry of wage distribution (the fact that most people earn less than the average amount).

Average wages of immigrants increased at a fast pace, but similar to wages in the economy as a whole. Wage growth in the Polish economy amounted to 9% y/y in 2025 Q2 and to 15% y/y in 2024 Q2. Such high values were related to the relatively good situation on the labour market. The average earnings of immigrants surveyed increased at a slightly faster rate (approximately 10% in 2025 and 17% in 2024). The increase in immigrant earnings was observed across the distribution (affecting both better and less skilled individuals). The growth in the lowest wages was supported by the structure of demand for labour in the economy and the strong rise in the minimum wage in 2024 (Figure 23).

The ranking of the best-paid immigrant professions remains unchanged, but a clear acceleration has been recorded in wage increases of immigrants employed in IT. Median net salaries derived from the survey data exceeded PLN 5,000 in the healthcare, construction, transport and IT sectors. In particular, in the IT sector, median wages among Ukrainian immigrants were almost 20% higher than a year earlier (Figure 25). On the other hand - as in the previous year - work provided directly to households was the relatively lowest paid job (services for households), followed by jobs in trade as well as in hotels and restaurants.

Figure 24. Sectors in which immigrants are employed

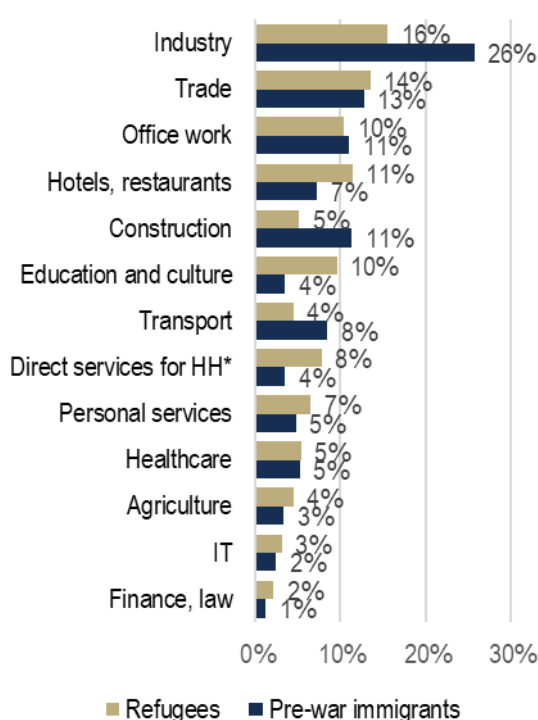

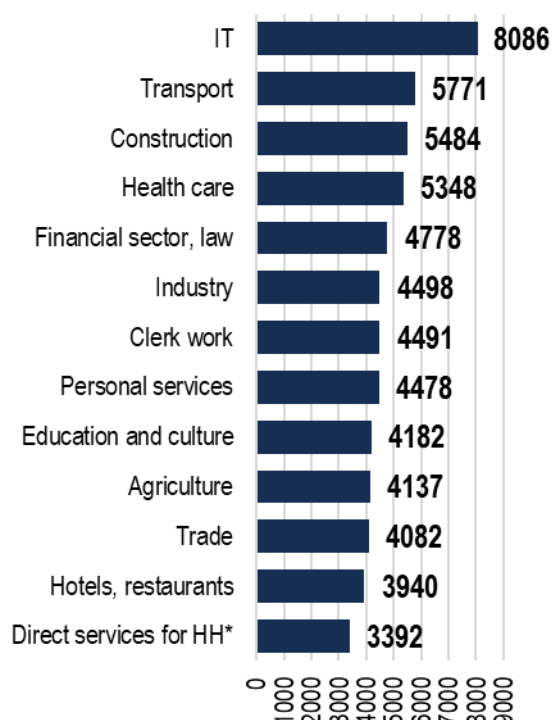

Figure 25. Medians of monthly net salaries of immigrants, by sector

*Services for households.

The better labour market situation of pre-war immigrants is the consequence of the fact that more of them are employed in sectors with higher wages. The 2025 survey shows that people

who arrived in Poland before the war are relatively more likely to be employed in industry (26% vs. 16% among refugees), construction (11% and 5%, respectively) and transport (8% and 4%, respectively). Female refugees account for the vast majority of those who have arrived since 2022. They work much more often directly for Polish households and in personal services and the hospitality industry. They are often employed in the education and culture sector jobs that require higher qualifications but are not necessarily associated with higher wages (Figure 24).

2.3. Use of qualifications of immigrants working in Poland

Immigrants from Ukraine are increasingly doing jobs that require specialist qualifications, but not necessarily tertiary education or human resources management. In 2025, the percentage of immigrants employed as unskilled workers decreased to 42%, from 44% in 2024 (it was 53% in 2023). Between 2023 and 2025, the percentage of immigrants saying that they use their qualifications at work increased from 33% to 41%. This change, however, concerned specific qualifications, rather than tertiary education (Figure 26). For occupations that required tertiary education or human resources management, the proportion of employment has not changed significantly, which may be the result of immigrants not having the required qualifications and barriers to the recognition of qualifications.

Figure 26. Qualifications used by immigrants in total in 2023-2025

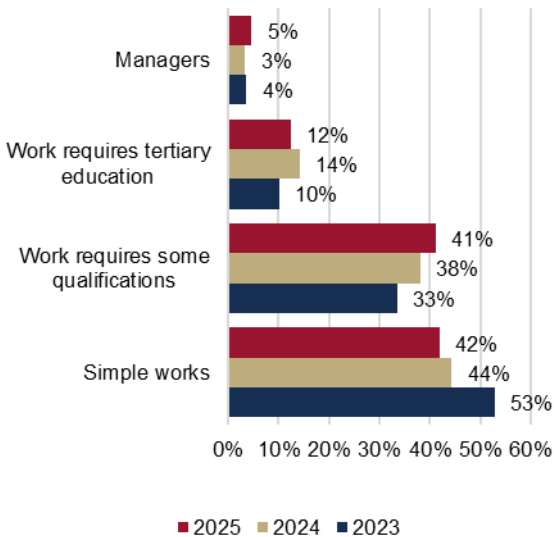

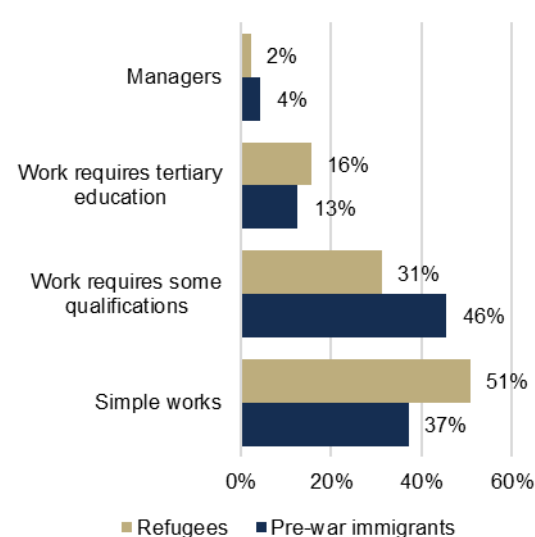

Figure 27. Qualifications used by refugees and pre-war migrants in 2025

Changes in the structure of professions take place in parallel among refugees and pre-war immigrants, but still refugees are much more likely to be employed as unskilled workers. The percentage of earlier immigrants doing unskilled work in 2025 was 33% and was 5

percentage points lower than the year before (Figure 27). Among refugees, unskilled work was performed by 49% (4 percentage points less than in the previous year). 6% of working pre-war immigrants (up 2 percentage points) and 4% of refugees (no change y/y) were employed in managerial positions.

Figure 28. Self-assessment of the work performed in Poland by refugees and earlier immigrants in 2025 and 2022

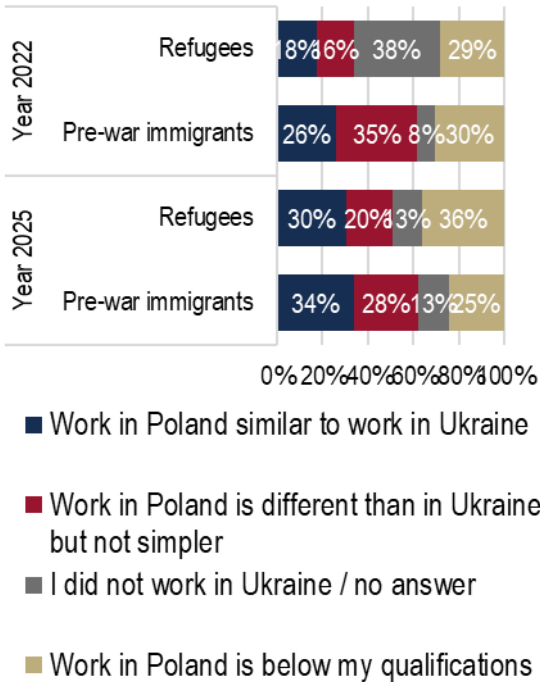

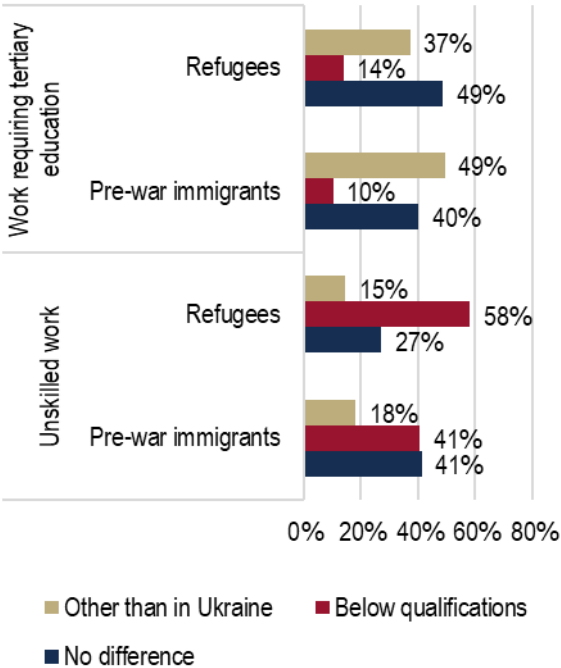

Figure 29. Qualifications used in Poland and self-assessment of work compared to work performed in Ukraine

The percentage of refugees who managed to find a similar job to that in Ukraine or who have retrained has increased significantly over the recent three years. Both in 2022 and in 2025, immigrants from Ukraine were asked a self-assessment question about their current job in Poland compared to the job they had in Ukraine. In 2022-2025, the share of working refugees judging that they were employed in Poland in similar jobs to those in Ukraine increased from 18% to 30%, and the percentage of those who retrained but the retraining was not connected with accepting a worse job increased from 16% to 20% (Figure 28).

In 2025, 36% of refugees and 25% of pre-war immigrants believed they were working in Poland below their qualifications. In 2022, a similar percentage (approximately 30%) of pre-war immigrants and refugees assessed that they were working in Poland below their qualifications (Figure 28). In 2025, the share of refugees declaring work below their qualifications has increased to 36% while the share of pre-war immigrants working below their qualifications

has decreased to 25%. The reason for such divergent trends may result from differences in the qualification profiles between the immigrant groups. Immigrants who arrived before 2022 were relatively more likely to be less educated and their goal was to find gainful employment with a higher income than in Ukraine. Over time, these individuals either found jobs better matched to their qualifications or returned to Ukraine. Female refugees were much more likely to have tertiary education and often qualifications that were more difficult to use on the Polish labour market. A large share of female refugees did not take up work in Poland immediately but had to do so over time to secure an income. Therefore, these immigrants may have encountered difficulties in finding a suitable job later.

Underemployment is most often the problem for refugees employed as unskilled workers. Approximately 58% of refugees doing unskilled work declared that it was a job below their qualifications. The figure for pre-war immigrants was 41%. On the one hand, this could have been a selection effect – a possible reason for earlier immigrants choosing economic migration was that their skills were low paid in Ukraine. On the other hand, the difference may result from the low demand in Poland for the qualifications that current refugees used in Ukraine (Figure 29).

Figure 30. Self-assessment of work done in Poland, by age and gender

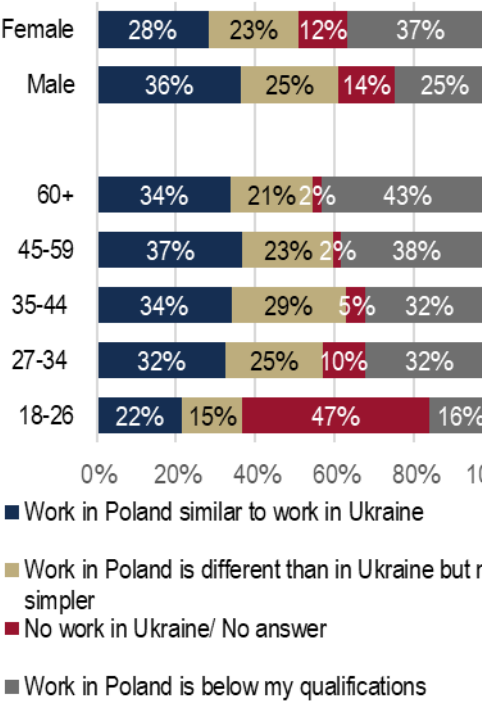

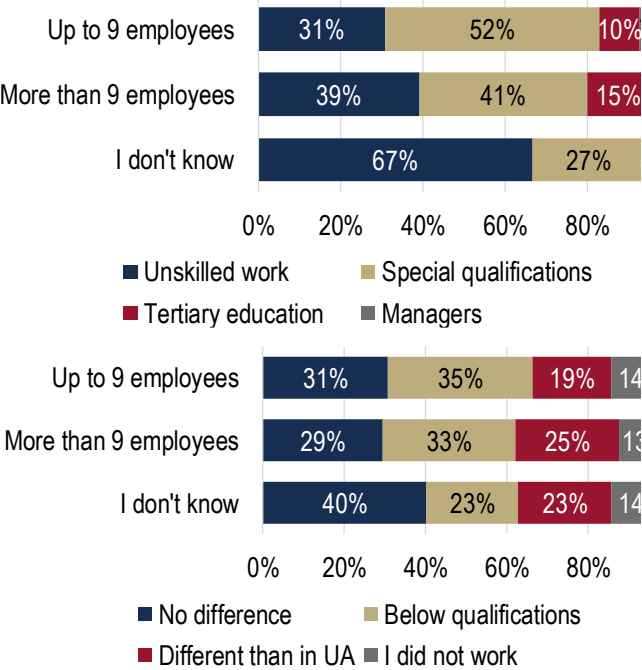

Figure 31. Self-assessment of work done in Poland by company size

Women and older (more experienced) workers more commonly responded that they had to work below their qualifications in Poland. The older the immigrants, the more often they search for the same kind of job in Poland as the they had in Ukraine and either find a similar job to the one they had before departure or, relatively more often than younger immigrants, get a job below their qualifications (Figure 30). Almost a half (47%) of the youngest adult Ukrainians (aged 18-26) had not worked before, so these individuals could not make any comparisons. People aged 35-44 relatively most frequently declared that they had successfully re-trained and found a different but not worse job in Poland than in Ukraine. Underemployment was more often declared by women, while men were more likely to find a similar job to that in Ukraine. A more in-depth analysis shows that the highest gender disparity in this respect occurs among those with at least a dozen years of work experience in Ukraine (aged 35-59).

The smallest Polish companies employ mainly immigrants with specific skills who relatively often indicate that they are overqualified for the job. Approximately 20% of immigrants in employment worked in micro companies (businesses with up to nine employees), 64% worked in larger companies and 16% did not define the size of the company they work for. Most of immigrants working in the smallest companies (52%) were employed in jobs that required qualifications but not tertiary education. About 36% of individuals working in small companies and 33% of those working in larger companies believed that they worked below their qualifications. The share of immigrants managing people (in managerial positions) was also slightly higher than in larger companies. In larger companies, immigrants were more likely to be employed as unskilled workers, but also in jobs requiring tertiary education (Figure 31).

3. Immigrant economic situation

3.1. Income of immigrants from Ukraine

As in the previous years, the main source of income for immigrants from Ukraine is work. Wages account for 81% of income of all immigrants (Figure 32). For pre-war immigrants it is 92%, for refugees - 78%.¹² Income from Ukraine and from Polish social benefits (in particular, the 800+ programme) supplement the earned income mainly in the case of refugees. On the one hand, this is due to the fact that refugees are more likely to have children in Poland than pre-war immigrants. At the same time, there is a higher percentage of unemployed among refugees, including those aged over 60, who receive money from Ukraine. There were no significant changes in the income structure of immigrants compared to the previous year. Polish social benefits account for 9% of the income of Ukrainian immigrants. They are received by 44% of immigrants – more often refugees (50%) than pre-war immigrants (33%) (Figure 33).

Figure 32. Income structure of immigrants from Ukraine in 2025

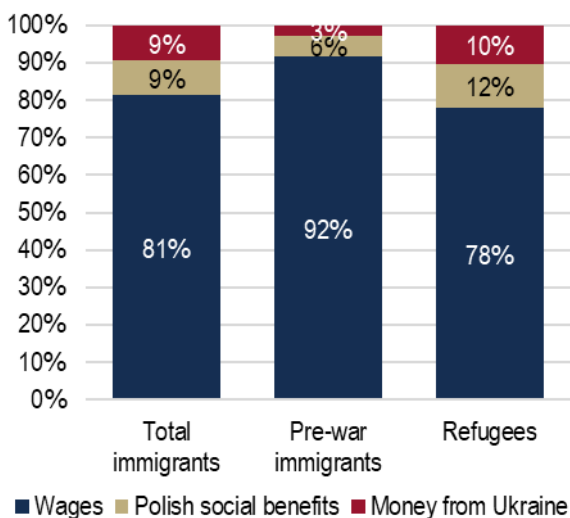

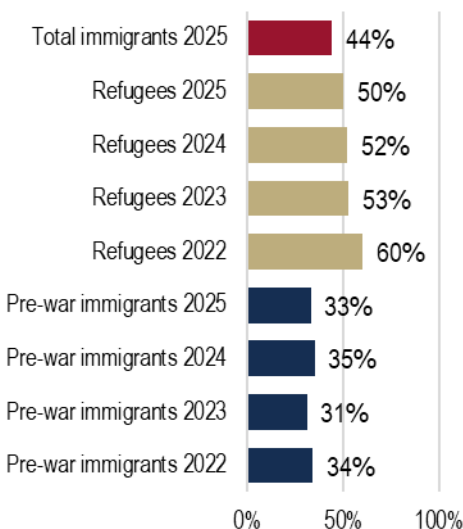

Figure 33. Percentage of immigrants receiving Polish social benefits in 2022-2025

The key benefit received by immigrants is the 800+ programme benefit, received by 39% of refugees and 30% of pre-war immigrants. While the percentage of pre-war immigrants receiving Polish social benefits, including the 800+ benefit, is stable (Figure 34), a downward trend is visible among refugees (Figure 35), which is related to the decreasing percentage of people

¹² 92% of pre-war immigrants and over 69% of refugees are employed.

with children among refugees. The percentage of people receiving a Polish pension and unemployment benefit in 2025 remains at a similar level as in 2024 – 2% of immigrants declare that they receive a Polish pension and 1% unemployment benefits.

* Answers do not add up to 100; it was possible to choose more than one answer

Figure 36. Percentage of Ukrainian immigrants receiving financial aid from Ukraine

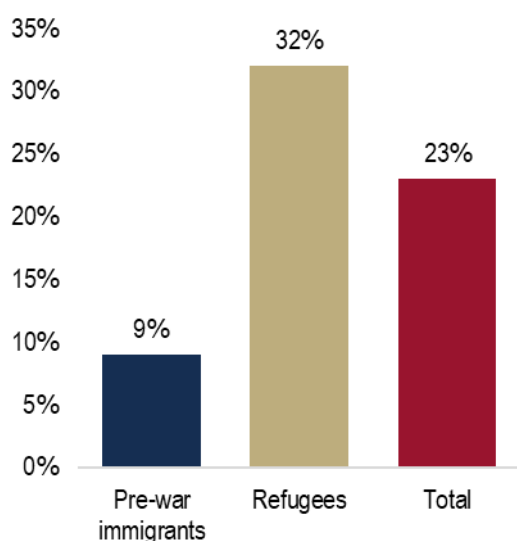

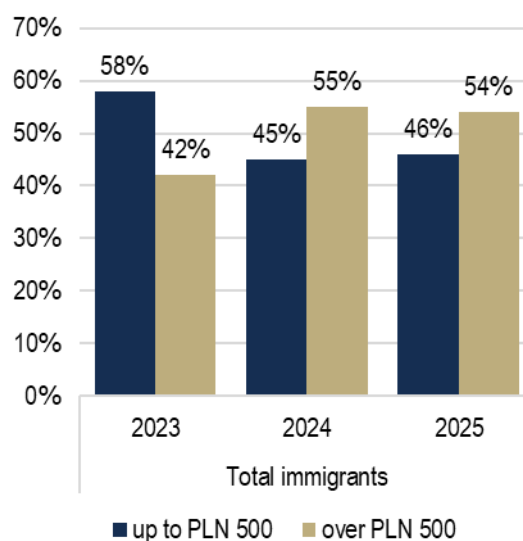

Figure 37. Amount of financial aid received on average per month by immigrants from Ukraine

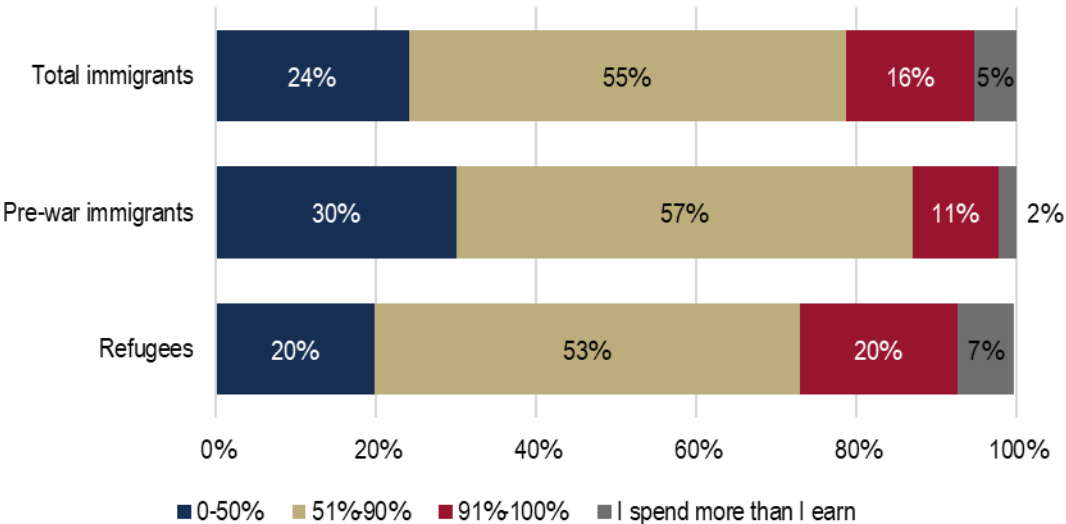

Funds deriving from Ukraine also supplement the earned income, in particular in the case of refugees. The percentage of immigrants receiving money from Ukraine remained similar as in 2023 and 2024, i.e. 23% of total respondents (Figure 36). Such funds are mainly received by refugees (32% of them). As in the previous years, remittances from Ukraine comprised pension and retirement benefits and financial aid from relatives in Ukraine. As in 2024, approximately half of the immigrants received financial aid below PLN 500 on average per month (Figure 37).

3.2. Expenses

The percentage of immigrants who spend almost their entire salary on the so-called living expenses has not changed significantly compared to 2024 and amounted to 16% (Figure 38). It is more common for refugees (20%) to spend their entire salary on living expenses than for pre-war immigrants (11%), due to the more difficult economic situation of the former. Approximately 5% of immigrants spend more than they earn and they are mainly refugees. Almost 60% of them receive money from Ukraine and/or from Polish social benefits.

Figure 38. Living expenses as a proportion of the average monthly net salary of migrant workers from Ukraine (employed persons)

Most immigrants meet satisfy their own housing needs by renting or buying a dwelling themselves. Among other forms of meeting housing needs, the most popular are employer-provided housing or living with a Ukrainian family.

Almost 82% of immigrants satisfy their housing needs themselves (in 2024, 76%), either by renting (73%) or owning their own dwelling (9%). Pre-war immigrants (84%) are more likely

to satisfy their housing needs themselves than refugees (77%), but the gap is narrowing year by year (Figure 39, Figure 40). The upward trend in the percentage of pre-war immigrants owning a home in Poland is noteworthy. Almost 17% of them declared that they owned their home (in 2024 it was 14%), which is undoubtedly evidence of their anchoring in Poland. The remaining 19% of respondents, who do not satisfy their housing needs on their own, most often use employer-arranged accommodation (6%) or live with a Ukrainian family (5%). In this respect, there is no change compared to 2024. However, a decrease in the percentage of people living in collective accommodation is noticeable (from 7% in 2024 to 5% in 2025). This decrease relates to refugees, as this form of housing was intended for them. Over 64% of the people living in such accommodation are over 45 years old.

Figure 39. Housing situation of pre-war immigrants in 2022-2025

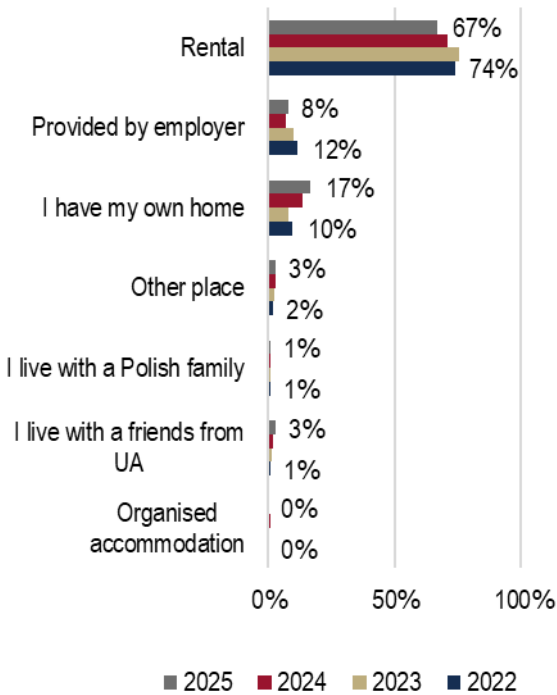

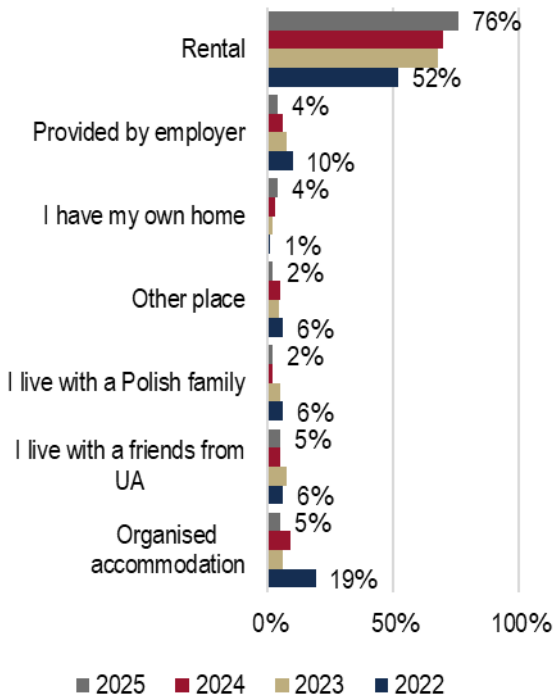

Figure 40. Housing situation of refugees from Ukraine in 2022-2025

3.3. Remittances to Ukraine

Immigrants continue to support their relatives in Ukraine financially, but a downward trend is observed in terms of frequency and amount of remittance. Nearly 43% of immigrants send money to Ukraine (40% in 2024) (Figure 41). This is more common for pre-war immigrants (55% of them), but an increase in the percentage of refugees sending money has been recorded (from 30% in 2024 to 36% in 2025). There is a noticeable decrease in the frequency of remittances and the average amount of remittance among immigrants compared to 2022. While in 2022, 33% of respondents declared remitting money to Ukraine at least once a month

or every 2-3 months, the share of such respondents dropped to 23% in 2025. A decrease in the frequency of remittances was recorded among both pre-war immigrants and refugees (Figure 42, Figure 43). As in previous years, the amount of the last remittance did not exceed PLN 1,000 in the case of most immigrants (**Błąd! Nie można odnaleźć źródła odwołania.** Figure 42, Figure 43). As in the previous years, money is mostly sent to immediate family members. This was declared by 82% of respondents. A total of 28% of respondents made remittances for the army. Other reasons of remittances include personal needs (12%), charities and other individuals (10%) and institutions (4%) (Figure 41).

Figure 41. Percentage of Ukrainian immigrants making remittances to Ukraine in 2022-2025

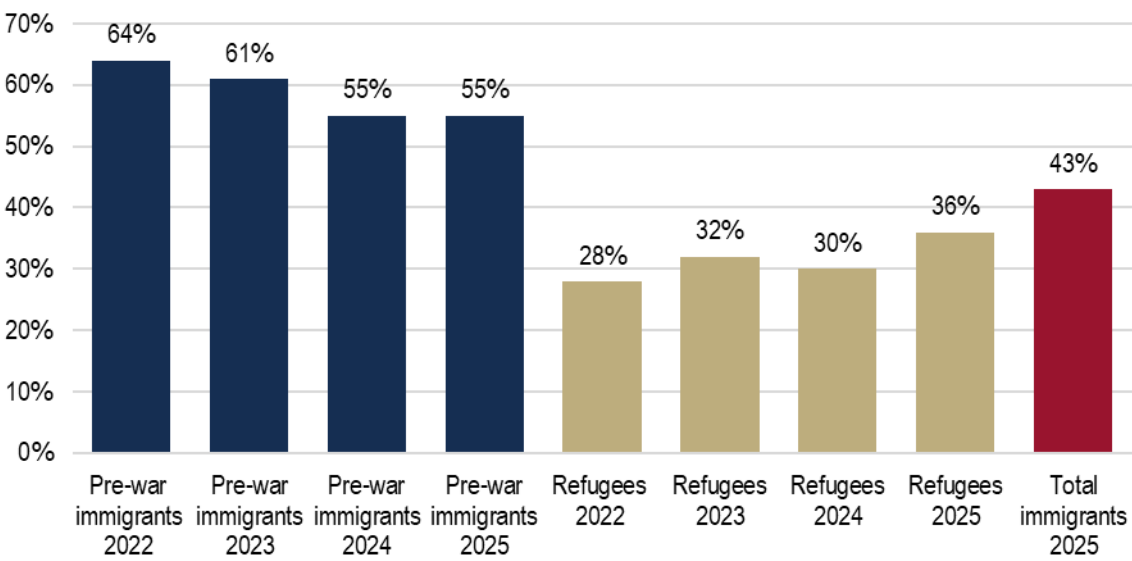

Figure 42. Pre-war immigrants making remittances to Ukraine - frequency of remittances

Figure 43. Refugees making remittances to Ukraine - frequency of remittances

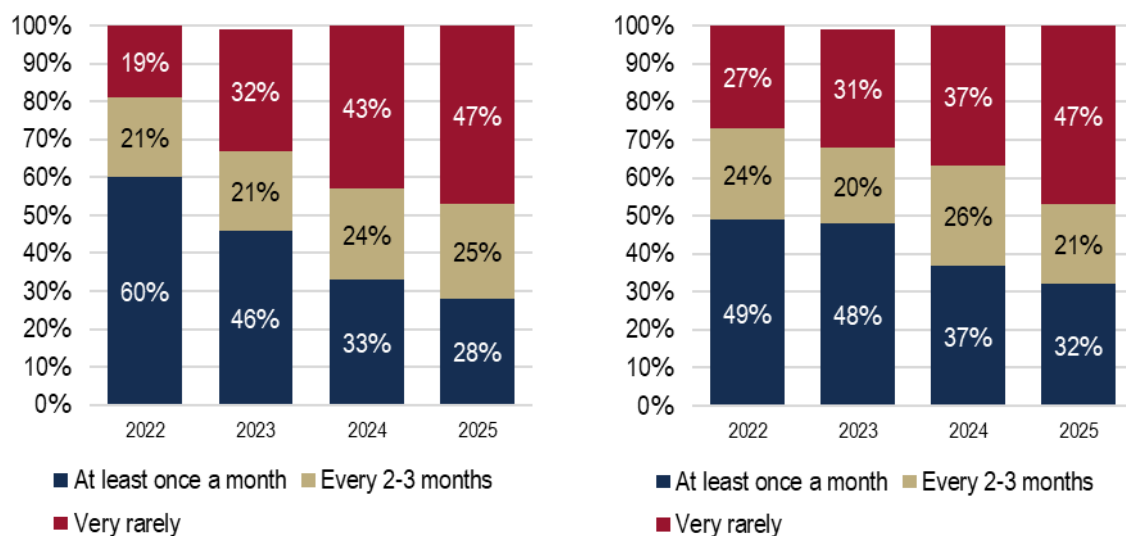

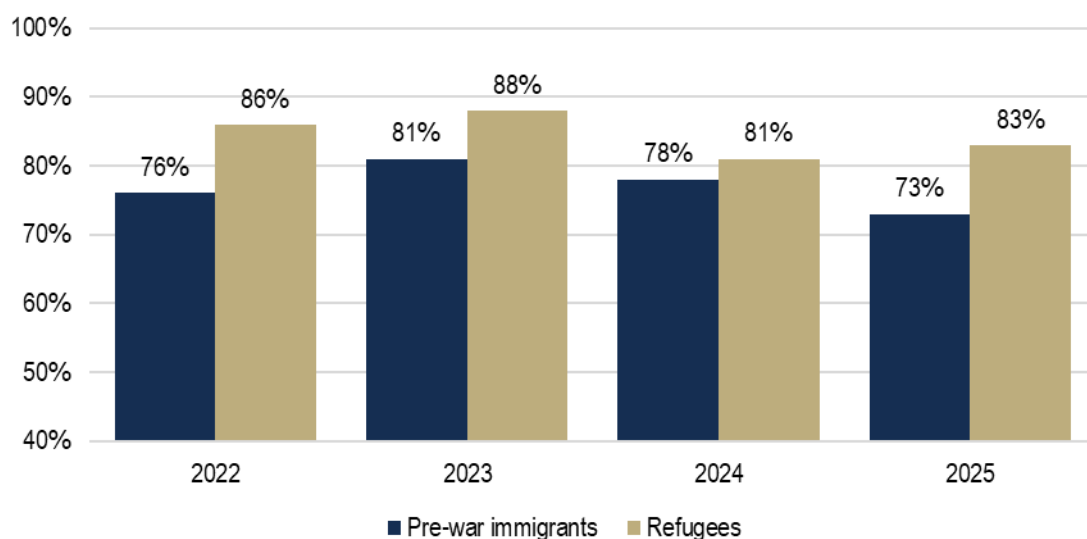

Figure 44. Percentage of immigrants making remittances to Ukraine with an average monthly remittance of less than PLN 1,000.

4. Immigrants' opinions and plans

An important part of the nationwide survey of immigrants from Ukraine is the question about their future plans concerning their stay in Poland and their opinions relating to the most desirable forms of aid in Poland. An analysis of the changes in the results of the responses to these questions allows for the current assessment of the sentiment among immigrants. Speculation about a potential truce or peace between Ukraine and Russia, which could change the situation of Ukrainian migrants, gave rise to an additional question on the opinion of how much such an event would change migrants' plans and the factors that constitute their motivation to stay in Poland.

4.1. Immigrants and their future place of residence

In 2025, the percentage of immigrants declaring their intention to stay permanently in Poland increased slightly (by 3 percentage points). More than a half of refugees had no specific plans. In 2025, 51% of pre-war immigrants (against 48% in 2024) and 24% of refugees (against 21% in 2024) had plans to stay permanently in Poland. The vast majority of refugees had difficulty in answering this question (56%). Uncertainty also persisted among pre-war immigrants (37%). It can be seen that despite the passage of time, the response proportions have been very stable since 2022. Declarations of a quick return to Ukraine were relatively common among refugees in 2023 (7% of responses), while it is now marginal among both pre-war immigrants and refugees (2% of responses) (Figure 45).

Declarations regarding the stay in Poland permanently are positively correlated with a good knowledge of the Polish language. Previous surveys¹³ indicate a very strong and universal relationship between the knowledge of the Polish language and the intention to stay permanently in Poland. The causality of this relationship is obviously bilateral – people who want to stay in Poland are more motivated to invest in learning the language, and on the other hand, a good knowledge of the language makes it easier to function in Poland and improves one's situation on the labour market, which in turn influences plans for the future. The current survey also confirms the existence of this very strong relationship (Figure 46). Among pre-war immigrants with a good knowledge of Polish, 55% declare that they will remain in Poland permanently (compared to 27-28% with a poorer knowledge of Polish). Among refugees with a good knowledge of the Polish language, 31-34% (depending on gender) declared that they

¹³ Data from previous surveys were used for econometric modelling of the characteristics of immigrants well correlated with the intention to stay permanently in Poland in Paweł Strzelecki's article, *Economic integration of immigrants from Ukraine in Poland in the context of demographic trends*, Studia BAS, 3 (79), 2024, pp. 37-61.

would remain in Poland permanently. Among refugees with poorer language skills, the figure reached 14-18%.

Figure 45. Plans to reside in Poland in the future

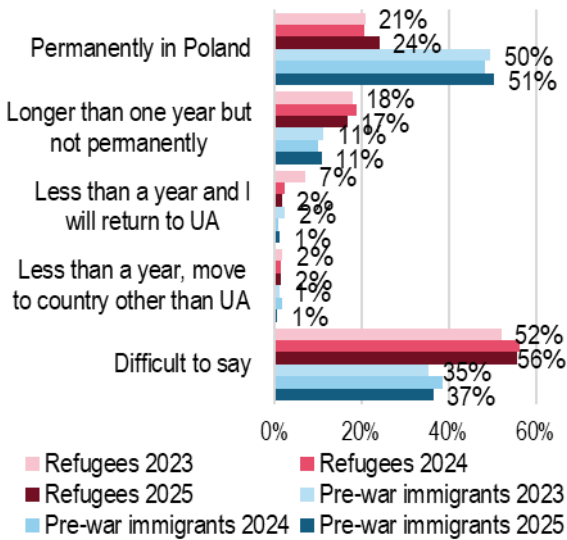

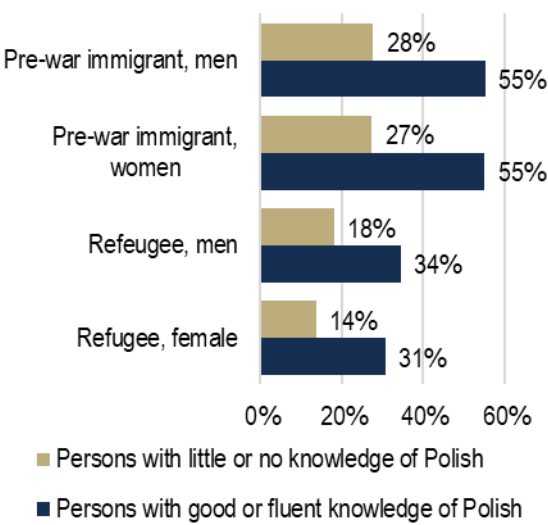

Figure 46. Percentage of immigrants preferring to stay in Poland permanently depending on the knowledge of the Polish language

Immigrants living outside major cities are less likely to declare that they will stay in Poland permanently. The influx of immigrants to Poland was initially mainly related to economic factors, and from 2022 onwards immigrants arrived in places where assistance was offered to them. In subsequent months, however, most of them also searched for work, striving to become independent. There are major differences between the opportunities to find a well-paid and stable job in large agglomerations and such opportunities in smaller urban centres, which probably translates into immigrants' plans to stay in Poland permanently. Far more of them are available to immigrants who live in voivodeship capital cities than among those who live outside them. This difference is particularly clear among immigrants who came to Poland before the war (Figure 47). In case of pre-war immigrants living in voivodeship capital cities, the percentage of people willing to remain in Poland permanently was 54%, while among those living outside agglomerations it was 44%.

Most often, the intention to stay in Poland was declared by males who arrived with children or entire families. Immigration to Poland caused by the full-scale war in Ukraine was the reason for the influx of mainly women and children to Poland. Surveys indicate that women

are less likely to declare that they would like to stay in Poland permanently, regardless of whether they are refugees or came to Poland before the war. Men, especially those staying in Poland with their children, are markedly more likely to declare the intention to stay permanently (Figure 48).

Figure 47. Planned permanent residence vs. the size of the place of residence in Poland

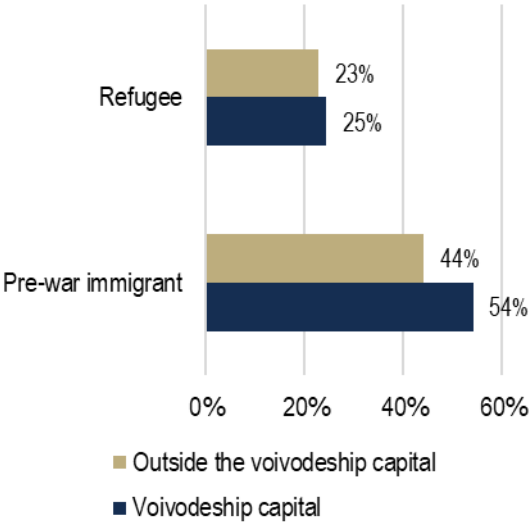

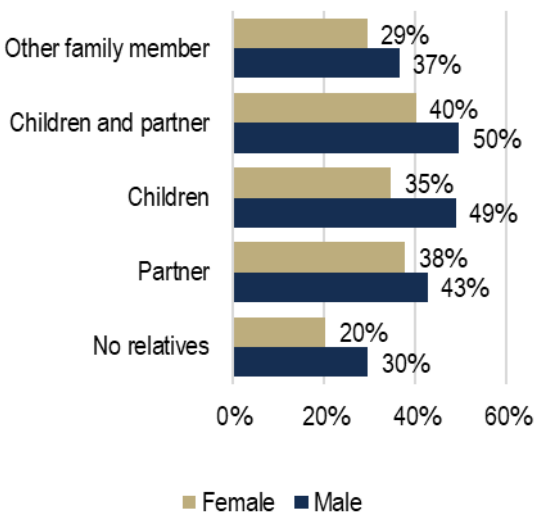

Figure 48. Planned permanent residence in Poland vs. family situation and gender

4.2. Factors that may have an impact on changes in immigrants' plans

The hypothetical conclusion of peace in Ukraine should not affect the decisions of the majority of pre-war immigrants and is difficult to assess in case of refugees. More than 50% of pre-war migrants assessed that the conclusion of peace in Ukraine would not affect their life plans, 24% of refugees expressed a similar opinion (Figure 49). Over 40% of refugees had no opinion on what they would do in such a situation. Those declaring specific actions were therefore a minority in both groups. Interestingly, the groups refugees choosing radically different responses to a hypothetical peace agreement were equally numerous. Approximately 13-14% of refugees declare that they would return to Ukraine and an equal percentage answered, “I will stay longer in Poland”. While the motivation for returning to Ukraine under such circumstances is clear, the declaration of a longer stay in Poland can be linked to the expectation of easier family reunion in exile after the cessation of hostilities. The higher percentage of pre-war immigrants declaring that they will stay in Poland longer after a hypothetical peace agreement than those who will consider returning to Ukraine under such circumstances can be interpreted in a similar way. Approximately 5% of immigrants assume that they will spend time

in both Poland and Ukraine after the peace agreement is reached, while 4% of respondents declared that they would bring their family from Ukraine to Poland.

Figure 49. Declared impact of a hypothetical peace agreement between Ukraine and Russia on the continued stay in Poland*

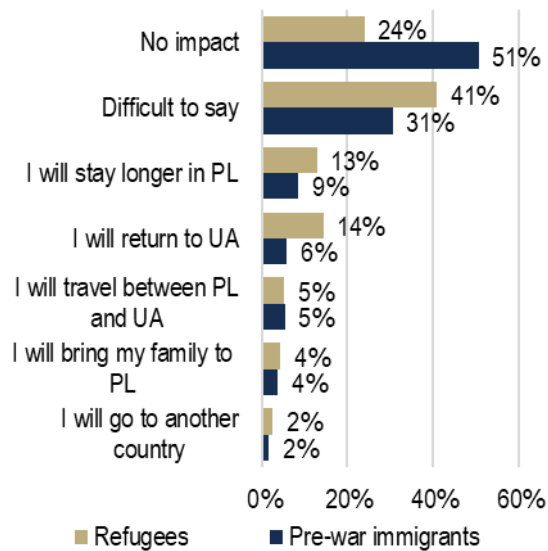

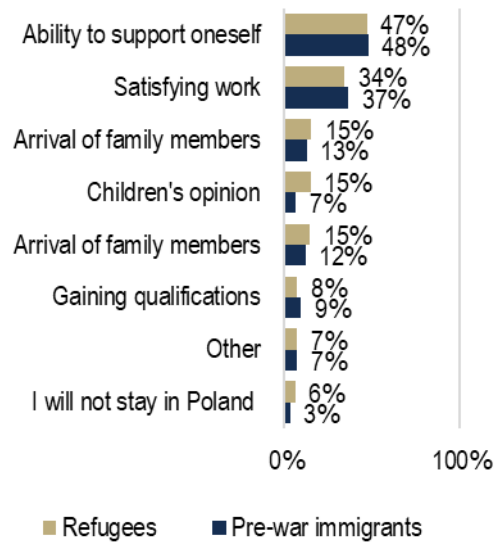

Figure 50. Factors influencing the decision to extend residence in Poland beyond one year (for those who reported a shorter residence)

*For the sake of saving space, abbreviations have been used in the figure: PL - Poland, UA - Ukraine.

The willingness to stay in Poland is mostly determined by factors related to the labour market. As in 2024, two most common responses to the question about factors that might influence an extension of stay in Poland were the ability to support oneself and one's family (44%) and a satisfying job (38%). Compared to a year earlier, the ability to support oneself and one's family was chosen slightly less frequently (over 48% of responses in 2024), while a satisfying job was indicated slightly more frequently (35% of responses in 2024). Also, the arrival of other family members from Ukraine was indicated slightly more frequently (especially by pre-war immigrants) as an event that would influence them to stay in Poland longer.

4.3. Opinions on potential support for immigrants in Poland

Easier legalisation of residence in Poland remains the most important potential facilitation for immigrants residing in Poland. The ability to legalise residence in Poland has been one of the most important issues mentioned in the NBP nationwide surveys since their inception, 2025 being no exception, both for pre-war immigrants (Figure 51) and among refugees (Figure 52). Among immigrants who came to Poland before the outbreak of the full-scale war, this

issue was considered important by 52% of respondents, down from 58% in 2024. This indicates that this matter still remains most important, but that some of the better-rooted immigrants in Poland are gradually succeeding in stabilising the conditions of their stay in Poland. On the other hand, uncertainty about the future of refugees remaining in Poland under the temporary protection regulations¹⁴ (registration in the UKR PESEL register) may explain the growing interest in this issue among those who came to Poland after the outbreak of the full-scale war. Within two years, facilitation of legalisation of residence has become the most important issue for this group of immigrants as well.

Refugees continue to indicate the great importance of the availability of Polish language courses. In the case of pre-war immigrants, issues related to improving their position in the labour market (free training, better job placement) were most often mentioned in subsequent places. In the case of refugees, Polish language courses have been the second most frequently mentioned facilitation measure since the beginning (Figure 52).

Refugees are becoming increasingly better adapted to the realities of life in Poland – assistance in finding work and accommodation is gradually becoming less important. As they adapt to the Polish labour market, refugees are less likely to mention assistance in finding a job or unemployment benefits. A steadily declining percentage of refugees also indicated assistance with accommodation and the possibility of dealing with official matters in Ukrainian as a desirable form of support (Figure 52).

Immigrants, as well as Polish citizens, emphasise limited access to the healthcare system. Easier access to healthcare is the third facilitation measure most often mentioned by earlier immigrants and refugees alike. On average, this answer was indicated more often by refugees or those staying in Poland for a relatively short time and planning to return to Ukraine within a year. This answer was selected less frequently by those staying in Poland with children and having relatively many Polish friends.

Immigrants residing in Poland rarely indicate a need for financial assistance in case of unemployment. As in the previous surveys, in 2025, a relatively low percentage of immigrants indicated (Figure 51) that financial support for the unemployed was important (7% of pre-war immigrants and 12% of refugees). This can be linked to the relatively favourable situation on the Polish labour market, allowing people to find employment quite quickly. The low popularity of this answer may also reflect the lack of expectations from the Polish state in this regard. Even in case of the unemployed, such a response was selected by approximately 20% of respondents.

¹⁴ The expiry date of the temporary protection legislation in Poland was successively postponed. The most recent amendment concerned the extension of the temporary protection provisions until March 2026.

Figure 51. Opinions* on the most important forms of assistance that would facilitate the stay in Poland for immigrants from Ukraine - pre-war immigrants in 2023-2025

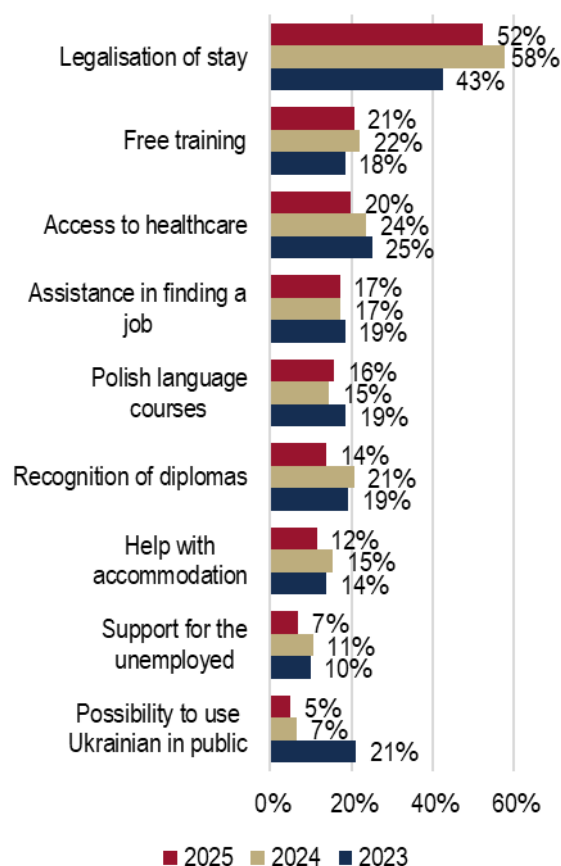

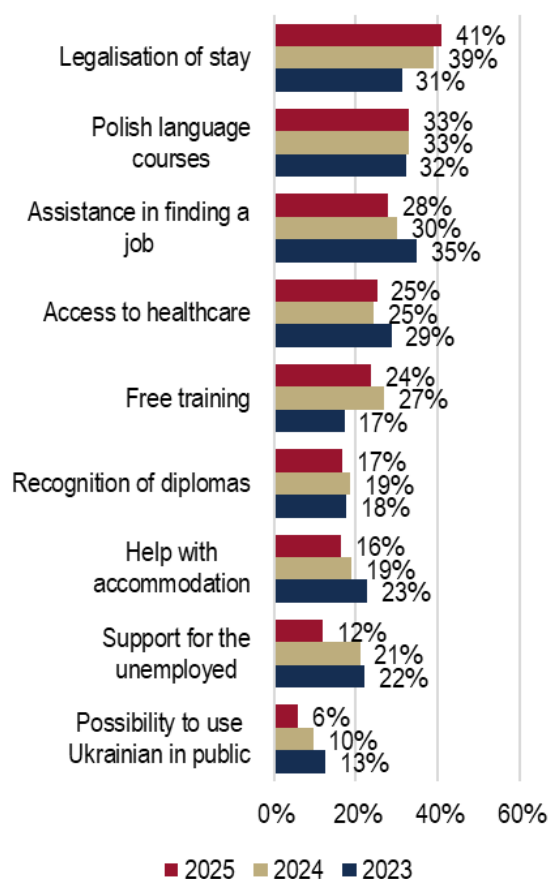

Figure 52. Opinions* on the most important forms of assistance that would facilitate the stay in Poland for immigrants from Ukraine - refugees in 2023-2025

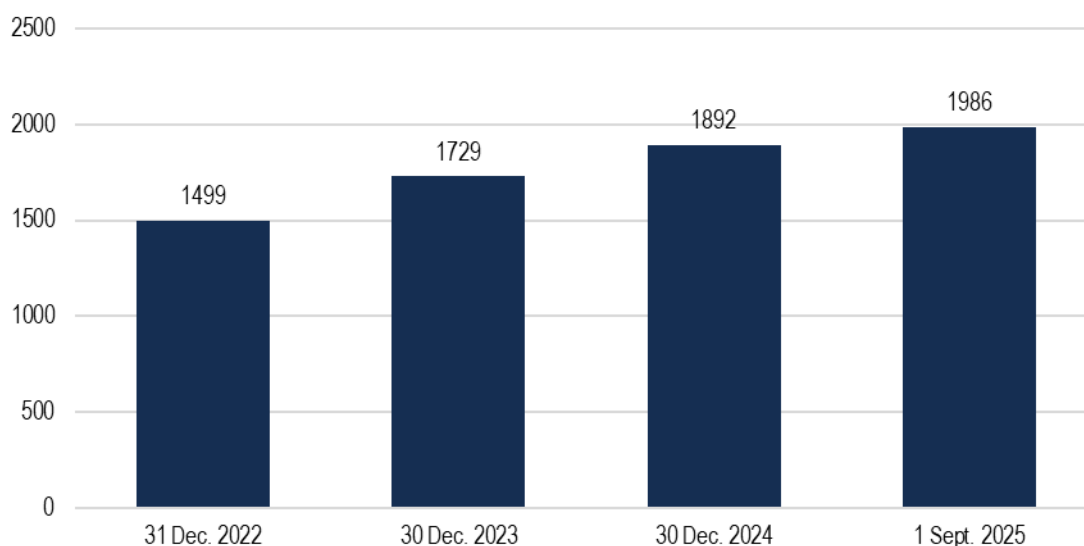

*Respondents in each survey could select up to three answers. The results do not add up to 100.

5. 2024-2025 refugee wave

According to data from the UKR PESEL register, the largest influx of refugees to Poland took place in 2022. At that time, 1,499 thousand applications for UKR PESEL were registered (Figure 53). It seems that this first refugee wave at the beginning of the war was largely characterised by strong emotions triggered by the outbreak of a full-scale war and the lack of time to prepare for the escape. However, the full-scale war has now been continuing for more than three years and refugees have been flowing into Poland continuously. In 2023-2025, 487 thousand applications for UKR PESEL numbers were registered in the UKR PESEL register (accounting for approximately 25% of all applications) (Figure 53). The share of persons under 18 in the total register is approximately 30%. It can therefore be assumed that of these 487 thousand registered applicants, at least 340 thousand are adults. Some of these people still reside in Poland.

Figure 53. Number of registered applications for the UKR PESEL status¹⁵ (in thousand).

On the other hand, 257 thousand people were registered in the UKR PESEL register in 2024-2025 (by 1 September). In order to better reflect the situation of refugees who have stayed in Poland for a relatively short period of time, questionnaires from people who arrived in Poland for the first time between 2024 and 2025 (approximately 10% of refugees) were used for further analysis. Hereinafter, these individuals will be referred to as the 2024-2025 wave refugees or refugees of the latest refugee wave. On the other hand, people who arrived in Poland in 2022 after the outbreak of the full-scale war in Ukraine are referred to as the first wave refugees.

¹⁵ Statistics on applications for UKR foreigner status in connection with the conflict in Ukraine - Open Data: Registered applications for granting the UKR status in connection with the conflict in Ukraine. As at 01.09.2025

5.1. Socio-demographic characteristics of the 2024-2025 wave refugees

Gender, age and family situation distinguish the 2024-2025 wave refugees from those who arrived shortly after the outbreak of the full-scale war. Women account for 56% of the refugees of the 2024-2025 wave and men - for 44%. In case of the first wave refugees of 2022, according to the NBP survey, 90% of respondents were female.¹⁶ Another factor that diversifies the refugee waves is the family situation. In 2022, at the initial stage of the war, almost 65% of refugees reported that they had come with their own or someone else's children, 24% alone and 14% with a spouse (Figure 54). Meanwhile, most of the refugees of the latest refugee wave are staying in Poland with their husband or wife (32%) and alone (32%). Approximately 27% are staying with minor children (Figure 55). It is not explicitly clear from the survey whether the refugees of the 2024-2025 wave came to Poland with these persons or whether these persons had already been staying in Poland before and the process of family reunion is taking place, but this is a likely explanation for some of the cases. Nevertheless, it can be concluded that it is indeed more common for refugees of the 2024-2025 wave to be staying in Poland with their partner and less common for them to be staying with their children. The percentage of people who have no family members in Poland is also increasing.

Figure 54. Did other family members come with you to Poland after the outbreak of the war (more than one answer could be selected; survey of April-May 2022)

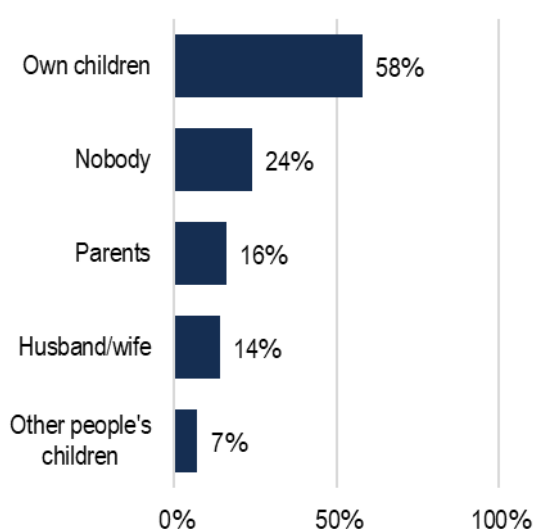

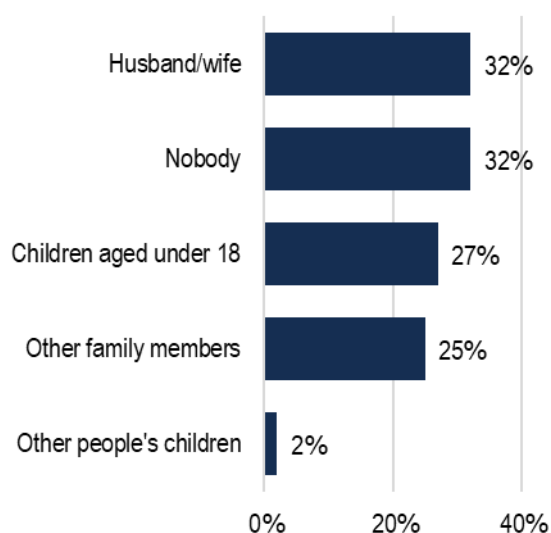

Figure 55. Persons who are staying in Poland with 2024-2025 wave refugees.

The largest age group among the 2024-2025 wave refugees are 18–26-year-olds, who represent 34% of all respondents regarding the age structure (Figure 56). This is a noticeably higher percentage than in 2022 (Figure 57) and also higher than among total refugees staying in Poland

¹⁶ *The economic situation of refugees from Ukraine in Poland. Report from the survey carried out by the NBP Regional Branches, Narodowy Bank Polski, Department of Statistics, Warsaw 2022.*

in 2025. Comparing the age structure of the 2024-2025 wave refugees with total refugees in 2025, in addition to the significantly higher percentage of the youngest people, a relatively high share of people aged 60 and over can be seen, which is surprising as people's mobility decreases with age.

Figure 56. Age structure of 2024-2025 wave refugees and total refugees from the 2025 survey.

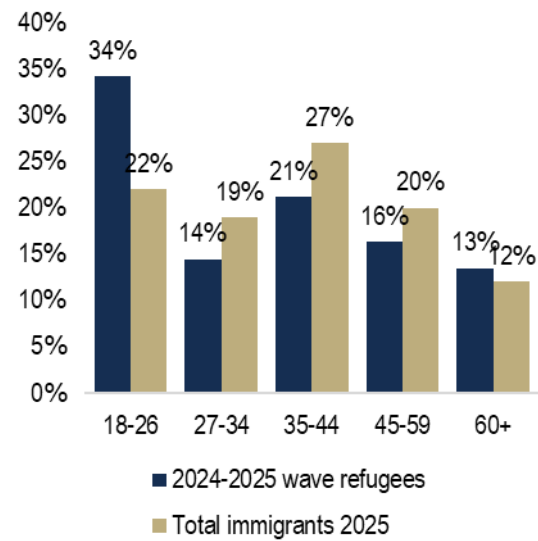

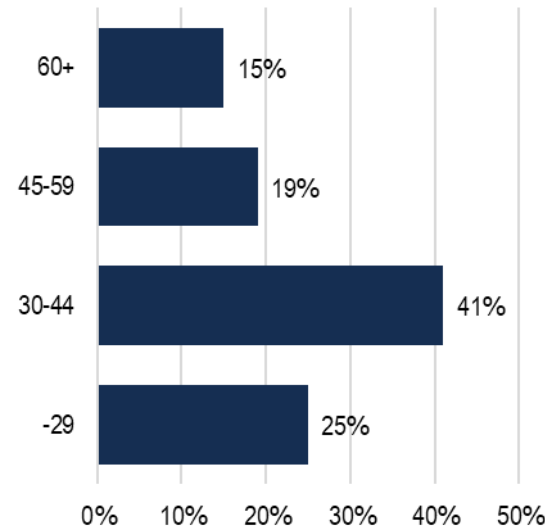

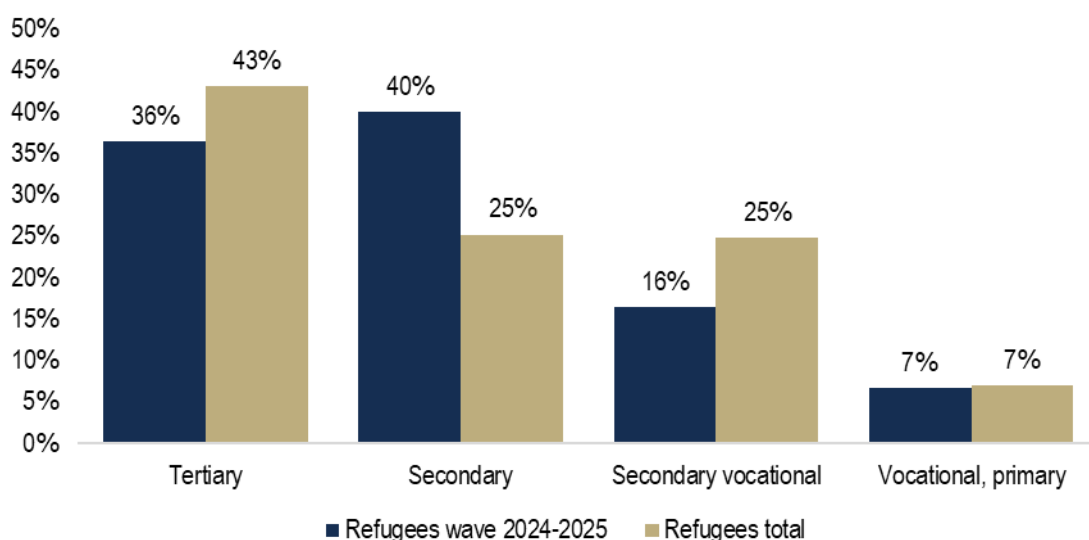

Figure 57. Age structure of the first wave refugees (survey April-May 2022)

To some extent, age determines the level of education of the latest wave of refugees. The high percentage of refugees aged 18-26 (more than 80% of whom have secondary education) results in a lower share of those with tertiary education (36%), both in relation to first wave refugees (50% of whom declared tertiary education) and total refugees in 2025 (43% have tertiary education) (Figure 46).

Figure 58. Education of 2024-2025 wave refugees compared to education of total refugees from the 2025 survey.

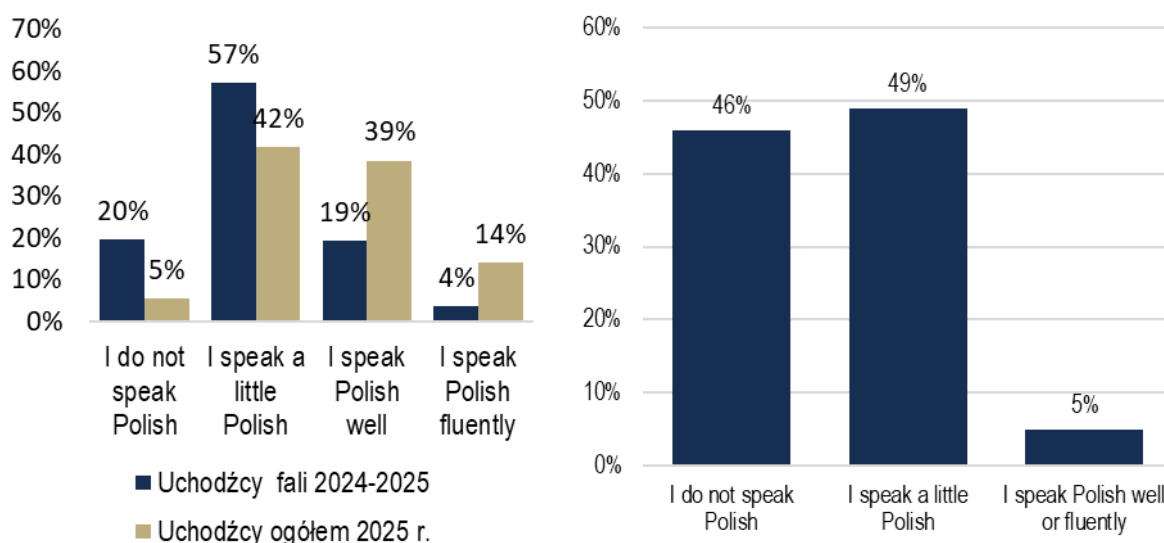

It should also be noted that, compared to the migration at the beginning of the war, fewer people with primary and vocational education are coming to Poland (in 2022, they accounted for 15%).

Refugees of the 2024-2025 wave come from all regions of Ukraine, although mostly from western Ukraine (24%). Their declared knowledge of Polish is at a lower level than that of refugees who have been staying in Poland longer (Figure 59). The highest percentage of newcomers say that they speak a little Polish (57%). Good or fluent knowledge of Polish is declared by 23% of refugees of the 2024-2025 wave compared to 53% of total refugees from the 2025 survey. In the spring of 2022, a significantly higher percentage of refugees said that they did not speak Polish (46%), which may be related to the fact that these individuals had stayed in Poland for a shorter period of time than the 2024-2025 wave refugees analysed. (Figure 60). It should be noted that in the spring of 2022, only 5% of refugees declared good knowledge of Polish, while among the refugees of the 2024-2025 wave, 23% of respondents declared good and fluent knowledge of Polish. This is the factor that distinguishes these two refugee waves.

Figure 59. Knowledge of Polish among 2024-2025 wave refugees and total refugees from the 2025 survey.

Figure 60. Knowledge of Polish among first wave refugees (survey April-May 2022)

5.2. Labour market situation of the 2024-2025 wave refugees

More than a half of the 2024-2025 wave refugees work, of which 33% have a permanent job, while 19% of respondents are economically inactive. The circumstances under which refugees of the latest wave arrive in Poland are somewhat different than in spring 2022. Poland has a much more numerous Ukrainian community, which that has established itself in the labour market. In most cases, arrivals do not take place under the influence of a life-threatening emergency, so it seems that they could be better prepared, including in terms of finding a job. It appears, however, that the situation of the 2024-2025 wave refugees on the labour market is varied and, in addition, a significant part of them do not come to Poland to work. Among recent refugees, the percentage of economically inactive people is high (19%). The most common age groups include people aged 18-26 (34%) and those over 60 (17%). More than 80% of these people receive funds from Ukraine. However, almost 57% of the refugees of the latest wave admit doing various types of work, which – considering that some of them have not been staying in Poland long – is a positive development (Figure 61). However, only 33% have a permanent paid job and 22% are searching for work, which means that unemployment among this group is higher than among refugees in general in 2025 (14%).

Almost 59% of the 2024-2025 wave refugees are employed as unskilled workers. Most of them work in industry. The main type of work carried out by refugees of this wave (similarly to total refugees in 2025) is unskilled work (59%) (Figure 62). The lack of knowledge or poor knowledge of the Polish language determines the nature of the work performed by refugees to some extent. However, in terms of having specialist qualifications, this factor is less important.

Figure 61. Labour market situation of 2024-2025 wave refugees

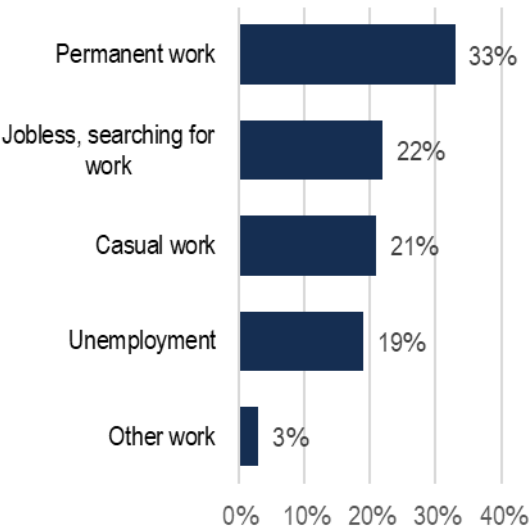

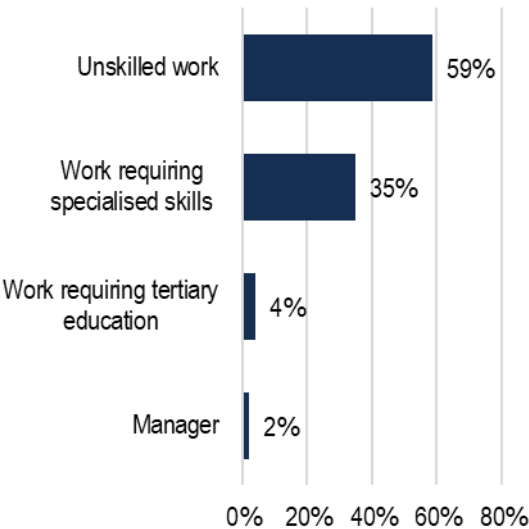

Figure 62. Type of work carried out by 2024-2025 wave refugees

Industry is the main sector where the 2024-2025 wave refugees work, as in case of the total refugee community in 2025 (Figure 63, Figure 64). It is also the sector of economy that offers the highest number of job vacancies. Other sectors where refugees of the latest wave work include mainly trade (11%), hotels and restaurants (9%). These latter sectors also employ a large percentage of total refugees in 2025.

Refugees of the 2024-2025 wave are most often employed in jobs they perceive as below their skill level. This is how 47% of respondents assess their situation on the labour market. This figure is significantly higher than that declared by the 2022 refugees (29%) and higher than that currently declared by total refugees (36%). Women are slightly more likely than men to indicate that they work below their qualifications. These figures mean that a significant percentage of refugees of the 2024-2025 wave decide to come and work in Poland below their qualifications. Nevertheless, 25% of respondents are employed in a job which they believe is in line with their qualifications; most often, these are people working in transport and trade.

Figure 63. Main sectors where 2024-2025 wave refugees work

Figure 64. Main sectors where refugees work overall, according to the 2025 survey.

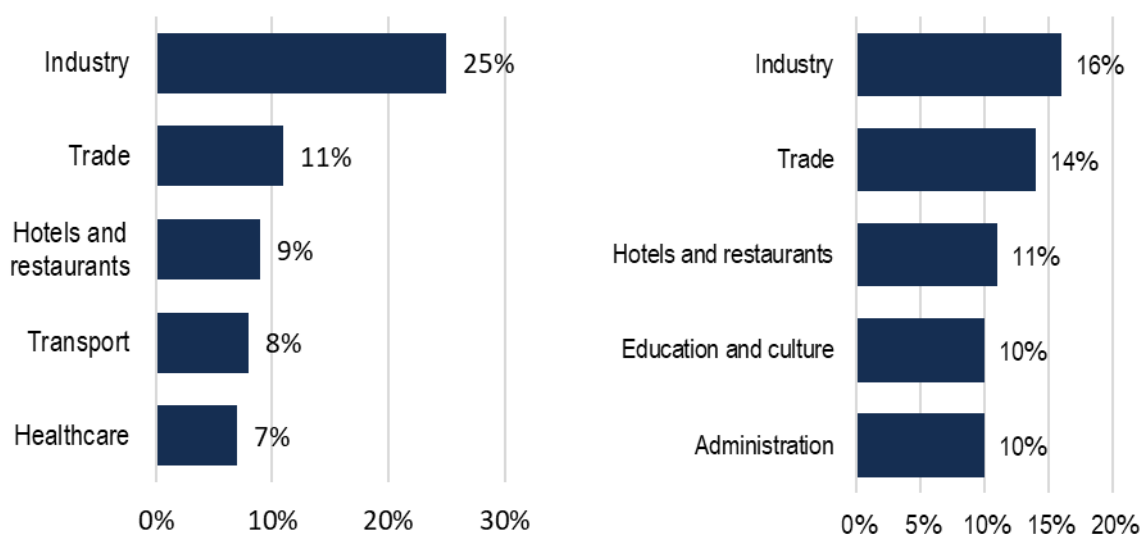

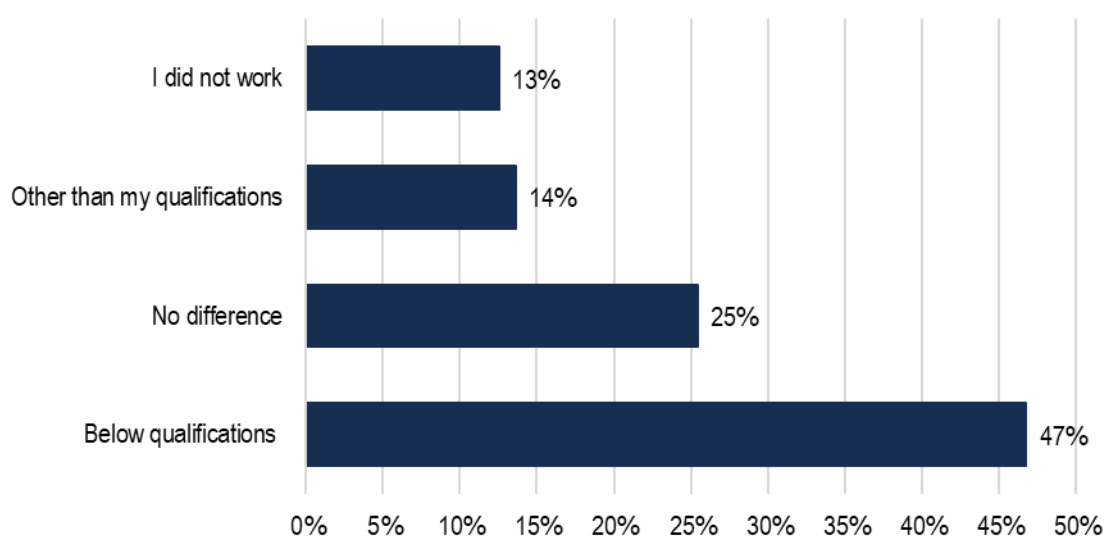

Figure 65. Assessment of the consistency of the work performed in Poland in terms of qualifications with the work performed in Ukraine by 2024-2025 wave refugees

5.3. Plans for the future and the most important needs of the 2024- 2025 wave refugees

Almost 60% of the 2024-2025 wave refugees have no clear plans for the future. Thus, for them the arrival in Poland is probably an escape to a safe place where they can wait until the war is over, while 19% of the refugees arrived in Poland to stay.

The prevailing answer to the question about plans for a continued stay in Poland is “difficult to say” (58%) (Figure 66). A total of 35% of refugees of the latest wave plan to stay in Poland for a longer term. These are more commonly people aged 27-59 (42%) than those youngest and oldest. Having analysed the plans of this wave of refugees, one can conclude that they are less willing than refugees in general to stay in our country permanently. It seems that the decision to come to Poland was mainly driven by the escape from the war, with no plans for the future.

Refugees of the 2024–2025 wave most often cited employment-related issues, such as finding a satisfying job and the ability to support oneself and one's family (38% each) as the two factors as likely to influence them to stay in Poland for more than a year. They also mentioned the arrival in Poland of family members who are currently in Ukraine as another factor of significant importance.

As far as assistance is concerned, refugees of the 2024-2025 wave mainly expected the organisation of Polish language courses (42%) and assistance in legalising their residence (41%).

The latest wave of refugees differs from the first wave in terms of fluency in Polish. This is reflected in the needs reported by immigrants. Refugees of the 2024-2025 wave are more likely to indicate the organisation of Polish language courses (42% of them) (Figure 67). The percentage of responses regarding easier legalisation of stay and assistance in finding a job is similar to the figure for total refugees in 2025, indicating the universality of these issues.

Figure 66. Structure of answers to the question: How long do you think your current stay in Poland will last?

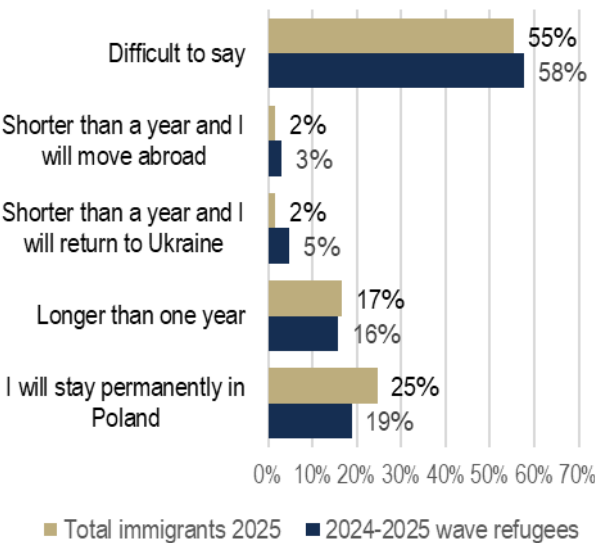

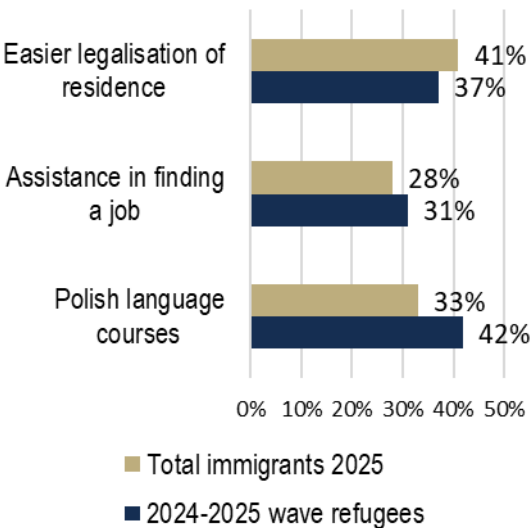

Figure 67. Most important needs of 2024-2025 wave refugees

6. Regional differentiation of migration from Ukraine in Poland

The previous chapters contain an analysis of the situation of immigrants from Ukraine on a national scale. However, register data show that the number of immigrants from Ukraine is strongly differentiated in regional terms: in some voivodeships their number is considerably higher, or they form a larger part of the total population. Furthermore, both the previous and the current survey indicate that regional differentiation also applies to the situation of immigrants in the local labour markets, the level of knowledge of the Polish language, further plans to stay in Poland, and the assessment of the needs of foreigners staying in Poland. These analyses are presented in subsection 6.1. On the other hand, the following subsections present analyses of the role of immigrants in selected voivodeships, more focused on the local characteristics of immigration in each voivodeship.

6.1. Selected elements of regional differentiation at the national level

Data on the number of people who obtained the right to temporary protection in Poland due to the war (referred to in the report as refugees) show that in June 2025 the largest group of such persons (217 thousand) was staying the Mazowieckie Voivodeship (Figure 68). Together with immigrants from Ukraine who were staying in Poland on the basis of other documents, immigrants in the Mazowieckie Voivodeship accounted for almost 6% of the number of Polish citizens residing in the voivodeship (Figure 69).

The second voivodeship in terms of the number of refugees was Dolnośląskie (117 thousand). With the exception of the Mazowieckie Voivodeship, and in particular the Warsaw metropolitan area, relatively lower proportion of the number of Ukrainian immigrants to the number of Polish citizens (approximately 2%) was observed in the eastern voivodeships, and a higher proportion in the west of our country (approximately 6%). As subsequent analyses show, this is highly correlated with the situation of immigrants on the local labour markets and to the further plans of immigrants.

Figure 68. Number of refugees from Ukraine by voivodeship¹⁷

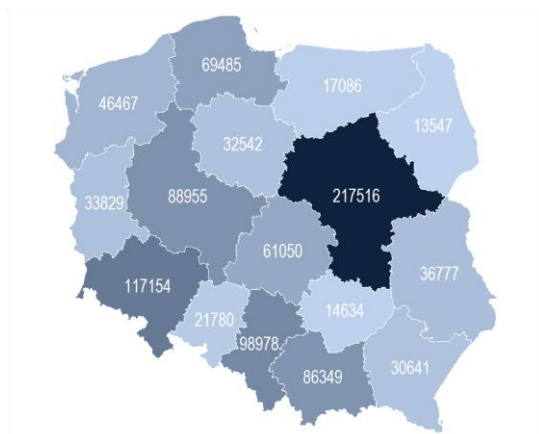

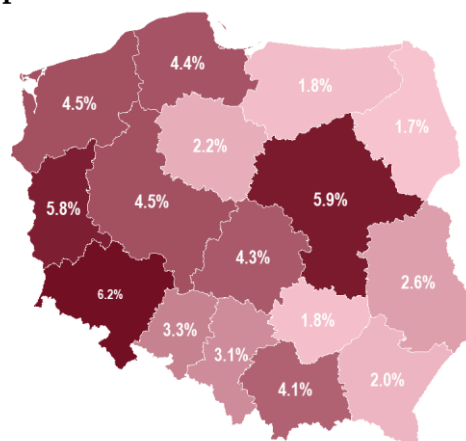

Figure 69. Proportion of immigrants from Ukraine to local population by voivodeship¹⁸

6.1.1. Labour market participation

Immigrants from Ukraine are very active on the labour market, with an average of 92% of them working or actively seeking employment in Poland. In many voivodeships, the percentage is even higher, especially in Lubuskie (98%), Pomorskie, Dolnośląskie (97% each), Wielkopolskie (96%) (Figure 71). The high labour force participation in these regions translates into a high percentage of the employed, well above the national average of 81%. In addition to the above-mentioned voivodeships with high labour market participation, the above-average percentage of employed immigrants is also recorded in the Warmińsko-Mazurskie Voivodeship and - due to a high share of seasonal work - in the Świętokrzyskie and Małopolskie Voivodeships (Figure 70).

The situation is different in some eastern and southern voivodeships, where - despite the fairly high labour force participation of Ukrainian immigrants - the percentage of people employed remains lower than the average level of employment for this group in Poland. In these regions, the percentage of employed people ranges from 60% in Lubelskie, 64% in Podlaskie and 65% in Opolskie. Regions with a lower share of the employed have a higher percentage of people who came to Poland after the outbreak of the full-scale war in Ukraine and older people aged over 60, which translates into lower readiness to take up employment. In addition, immigrants

Population status and structure and natural movement by territory in 2024 (as at 31 December).

staying in these voivodeships often move to Ukraine and are less likely to declare that they will stay permanently in Poland.

Figure 70. Share of the employed in the total number of immigrants

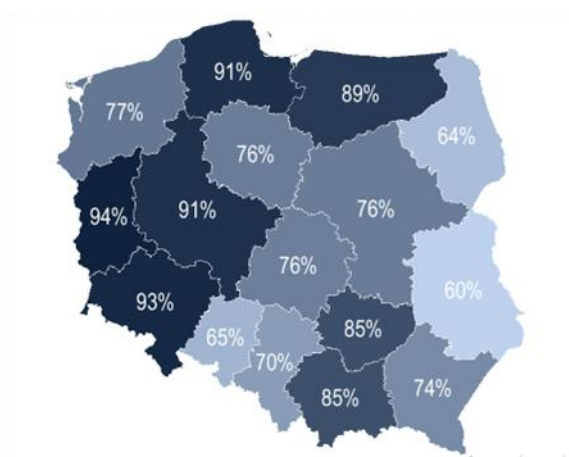

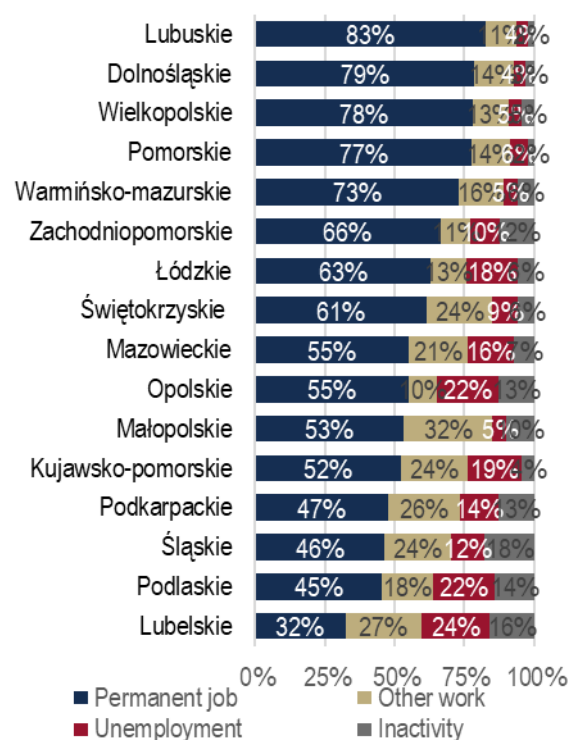

Figure 71. Labour force participation of immigrants by voivodeship

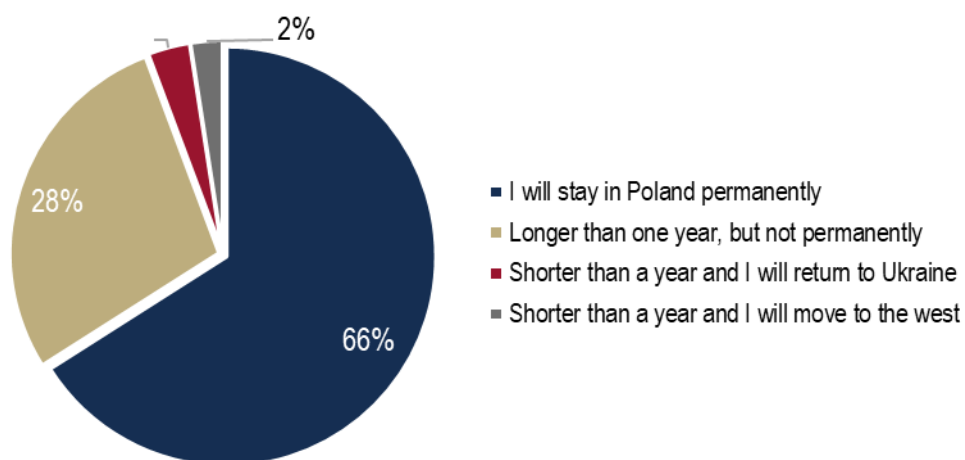

Most immigrants have a permanent job, especially in the western and northern voivodeships, such as Lubuskie (83%), Dolnośląskie (79%), Wielkopolskie (78%) or Pomorskie (77%). In the eastern and southern regions, permanent employment is less common, e.g. in Śląskie (46%), Podlaskie (47%) and Lubelskie (32%), where casual work is relatively more popular than in other voivodeships.

6.1.2. Residence plans

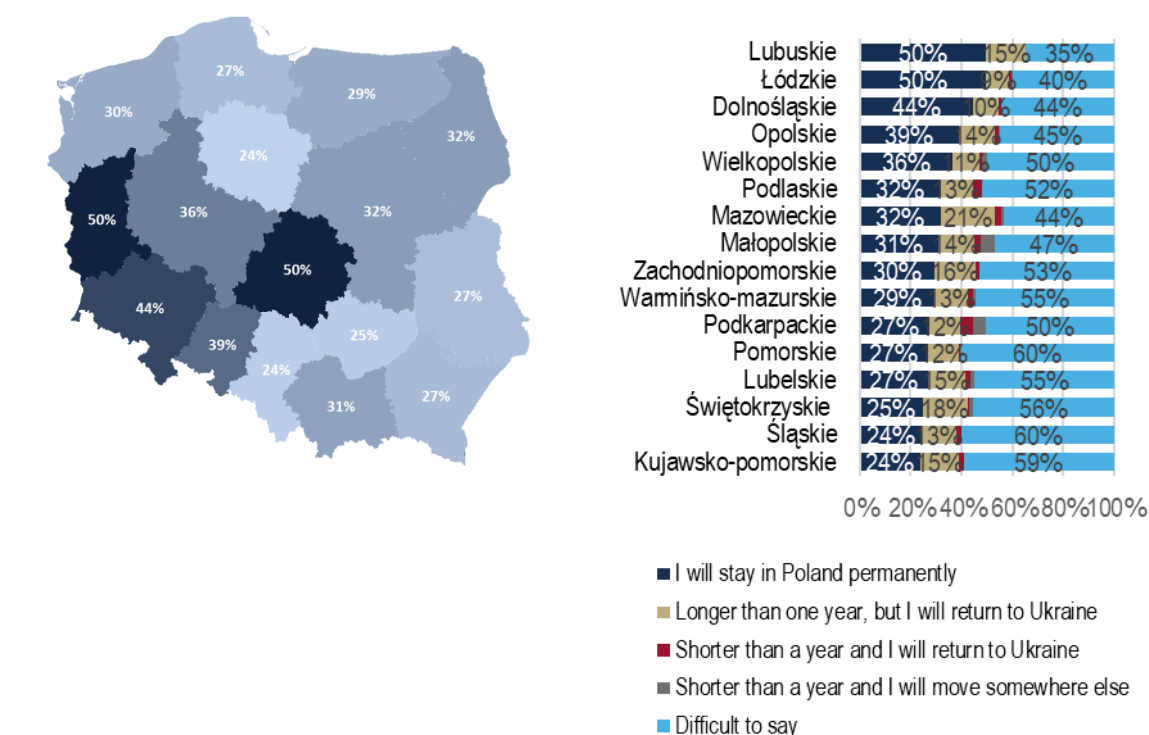

The survey showed that almost half of the respondents are undecided and unable to specify their plans for the future. Among Ukrainian immigrants who have specified how long they were planning to stay in Poland, 66% declare to stay permanently and only 5% expect to leave Poland within the next year (Figure 72).

Figure 72. Planned length of the current stay in Poland of immigrants from Ukraine (excluding those undecided who answered “difficult to say”)

Among immigrants planning to stay in Poland permanently, the highest percentage stays in the Lubuskie and Łódzkie voivodeships (50% each) and the Dolnośląskie voivodeship (44%). Immigrants are least likely to settle in Poland in the Kujawsko-Pomorskie, Śląskie (24% each), Świętokrzyskie (25%) voivodeships as well as in the south-eastern voivodeships neighbouring Ukraine: Podkarpackie and Lubelskie (27% each) (Figure 73, Figure 74).

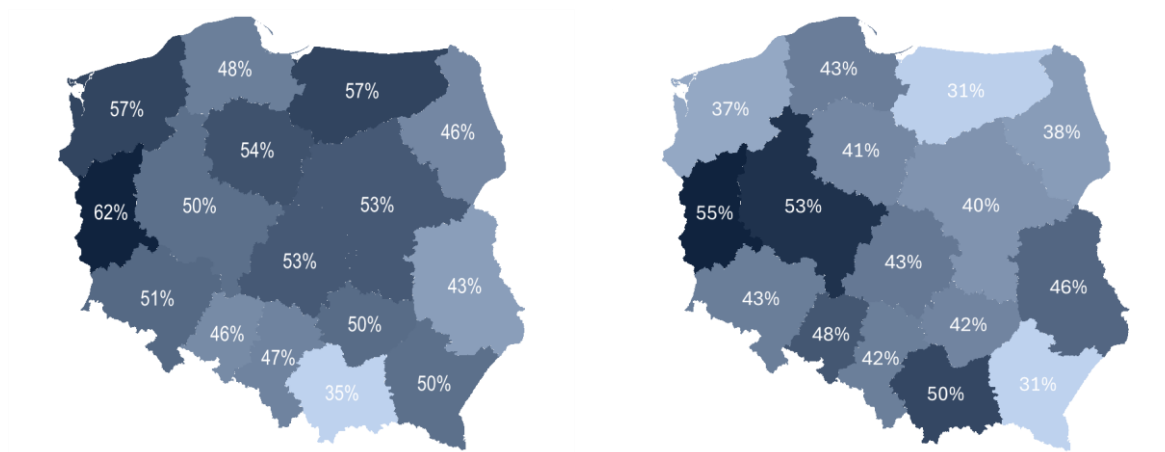

Figure 73. Share of immigrants planning to stay in Poland permanently **Figure 74. Plans of immigrants**

Finding a satisfying job and earning enough to support themselves and their family are the main reasons that respondents identify as those that would convince them to stay in Poland (Figure 75, Figure 76). The highest number of responses indicating these two factors was recorded in the Lubuskie voivodeship. In other voivodeships, the results of the aggregated responses were at a similar level. The arrival of the family in Poland was important to respondents in the Opolskie Voivodeship (26% of responses), Łódzkie Voivodeship (22% of responses) and Pomorskie Voivodeship (20% of indications).

Figure 75. Percentage of responses indicating the ability to support oneself and one's family as a factor influencing the decision to stay in Poland for more than a year, by voivodeship

Figure 76. Percentage of responses indicating finding a satisfying job as a factor influencing the decision to stay in Poland for more than a year, by voivodeship

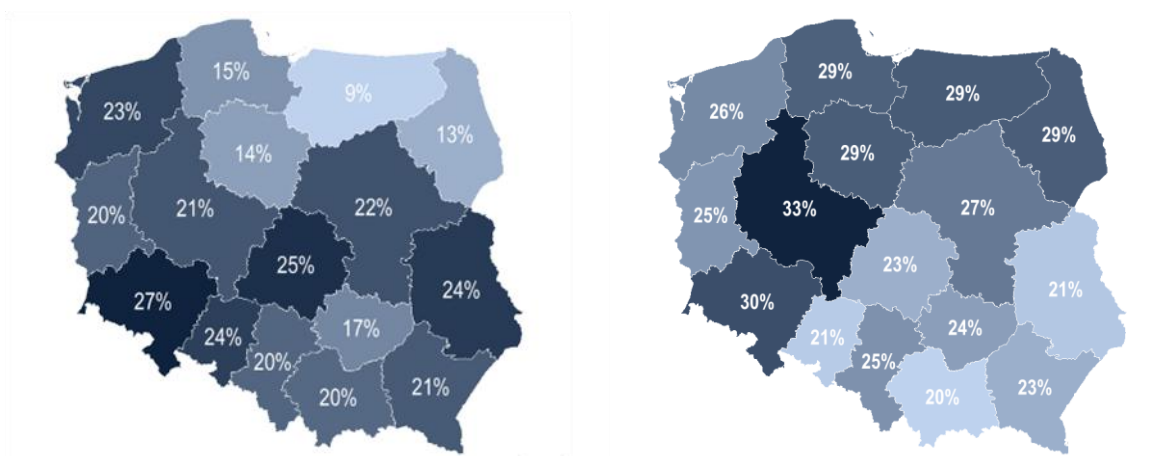

6.1.3. The most important needs of immigrants

When considering the aspects that facilitate the stay and work in Poland, knowledge of the Polish language is a very important issue for Ukrainian immigrants.

In the 2025 survey, proficiency in Polish at the national level was declared by 22% of respondents. The highest percentage of immigrants with fluent knowledge of Polish (Figure 77) stays in the Dolnośląskie (27%), Łódzkie (25%), Opolskie (24%), Lubelskie (24%) and Zachodniopomorskie (23%) voivodeships. Persons residing in north-eastern Poland, in the Warmińsko-Mazurskie, Podlaskie and Kujawsko-Pomorskie Voivodeships are the least proficient in Polish. It is worth noting that also in the Świętokrzyskie Voivodeship there is a percentage of people who declared a significantly lower proficiency in Polish than the national average. In other voivodeships, the knowledge of the Polish language among Ukrainian immigrants remains at the national average level or slightly below.

Figure 77. Percentage of immigrants fluent in Polish by voivodeship

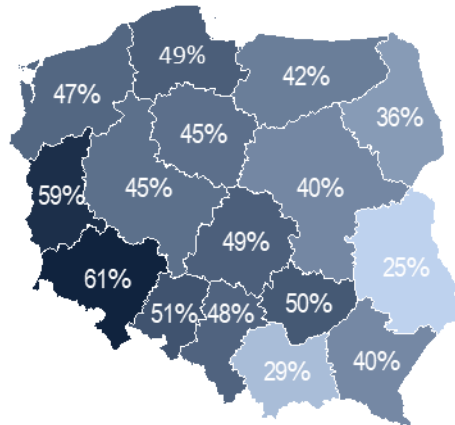

Figure 78. Percentage of immigrants indicating a Polish language course as one of the most important forms of assistance by voivodeship

Although immigrants demonstrate a good command of Polish, 27% of respondents indicated that attending organised Polish language courses would be one of the most important forms of assistance to facilitate their stay and work in Poland. Respondents from the voivodeships of north-eastern Poland, where knowledge of Polish is at a low level, declare interest in such assistance relatively often. On the national scale, the greater need to attend such courses does not always coincide with weaker language skills. An example is the previously mentioned Świętokrzyskie voivodeship, where low language proficiency (17%) does not translate into a high need for Polish language courses (24%); respondents there were more likely to indicate assistance in finding a job or easier access to healthcare. On the other hand, in the Wielkopolskie Voivodeship, where language proficiency remains at the national average level, the need for Polish courses was indicated by as many as 33% of respondents (Figure 78), significantly exceeding the national average. A greater willingness to attend Polish language courses can be seen in the voivodeships where immigrants responded that they wanted to stay permanently in Poland.

The analysis of immigrants' needs is a very important element for the development of integration policies at the local, regional and also national level. Immigrants' needs range from the willingness to attend Polish language courses or easier access to healthcare to assistance in finding work or accommodation. However, immigrants perceive the processes for arranging documents to legalise their stay as the greatest difficulty. Assistance in legalising residence in Poland was identified as the most important form of assistance in almost all voivodeships in Poland (Figure 79).

Figure 79. Share of immigrants indicating facilitation of legalisation of their stay in Poland as the most important form of assistance, by voivodeship

The national average regarding the need for facilitation of residence legalisation is 45%. Only in the Lubelskie Voivodeship did the respondents indicate assistance in finding a job as the most important form of support that would facilitate their stay in Poland. It is worth noting that the Lubelskie voivodeship is the region with the lowest percentage of working immigrants in the whole Poland (Figure 70). Apart from the Lubelskie Voivodeship, indications of legalisation of residence as an expected form of assistance were significantly below the national average in the Małopolskie (29%) and Podlaskie (36%) Voivodeships. The percentage of people for whom assistance in legalising their stay would be the most important form of support increases as one moves westwards from the Polish-Ukrainian border. The highest number of responses concerning the support in this area were indicated in the Dolnośląskie (61%), Lubuskie (59%) and Opolskie (51%) voivodeships.

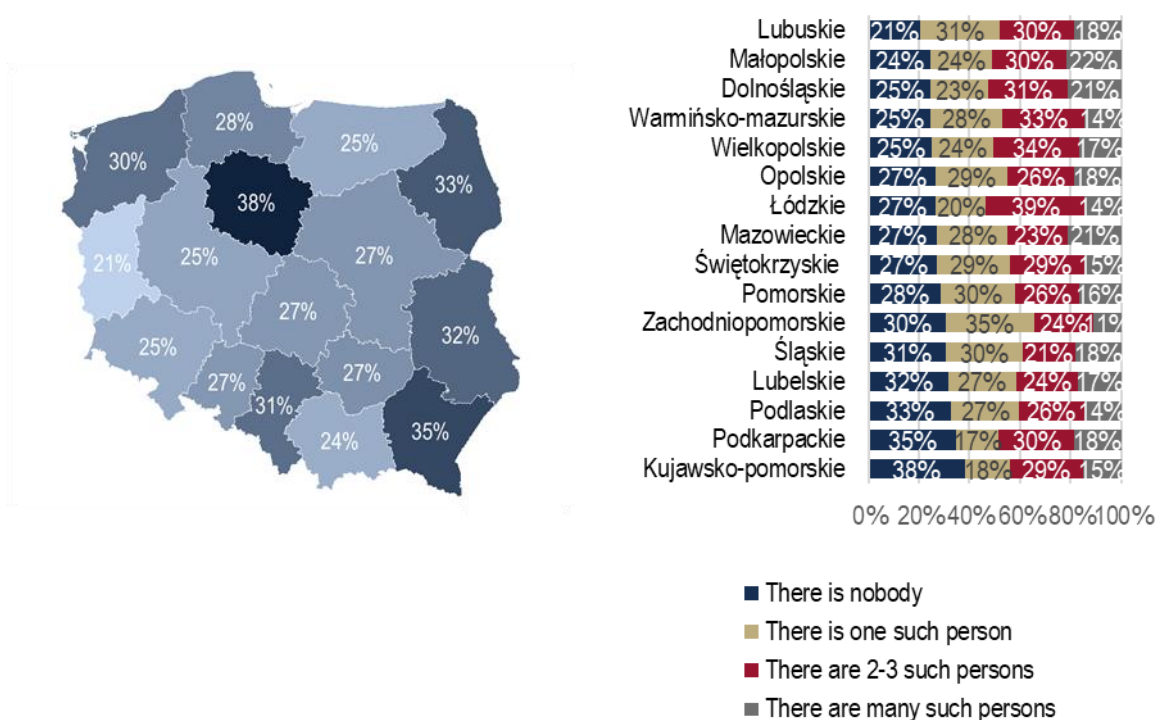

6.1.4. Networking among Poles

For the first time in the survey, Ukrainian immigrants were asked a question whether there was somebody among their Polish acquaintances whom they could ask for advice on difficult matters and how many such people they knew. The level of loneliness, understood as a situation where the immigrant does not know a single person like that among Poles, stands at 27% nationwide. The Kujawsko-Pomorskie voivodship, where this indicator is 38%, deviates upwards from the national average, as do the voivodships of eastern Poland: Podkarpackie (35%), Podlaskie (33%) and Lubelskie (32%) (Figure 80, Figure 81).

The Lubuskie voivodeship, where this indicator stood at a level of 21%, as well as the Małopolskie voivodeship (24%) and the Dolnośląskie, Warmińsko-Mazurskie and Wielkopolskie voivodeships (25% each) are below the national average.

Figure 80. Percentage of persons without contacts among Poles by voivodeship

Figure 81. Structure of answers to the question about networking among Poles (Is there somebody among your Polish acquaintances whom you can ask for advice?)

The language barrier may be one of the most important factors responsible for the lack of relations between immigrants and Poles. On a national scale, 22% of immigrants declare fluency in Polish. In the Kujawsko-Pomorskie and Podlaskie Voivodeships, this figure stands at 14% and 13%, respectively. This may indicate a lower possibility of integration with the Polish population.

The percentage of immigrants planning to stay in Poland permanently is another indicator that may explain the number of people without acquaintances among Poles. In the Kujawsko-Pomorskie voivodeship, this figure stood at 24% against the national average of 34%. Podlaskie, Podkarpackie and Lubelskie Voivodeships also recorded a score below the national average. On the other hand, the Łódzkie and Lubuskie voivodeships (50%) and the Dolnośląskie voivodeship (44%), are well above the average. It is likely that those who are not planning to stay permanently do not see the need to build deeper relationships with the local population.

Working together is yet another important factor in establishing relationships with Poles. Labour market participation among Ukrainians is 81% on average across Poland. It is significantly lower in eastern Poland and higher in the voivodeships of western Poland. 60% of the immigrant population in the Lubelskie voivodeship are economically active, 64% in the Podlaskie voivodeship, 74% in the Podkarpackie voivodeship and 76% in the Kujawsko-

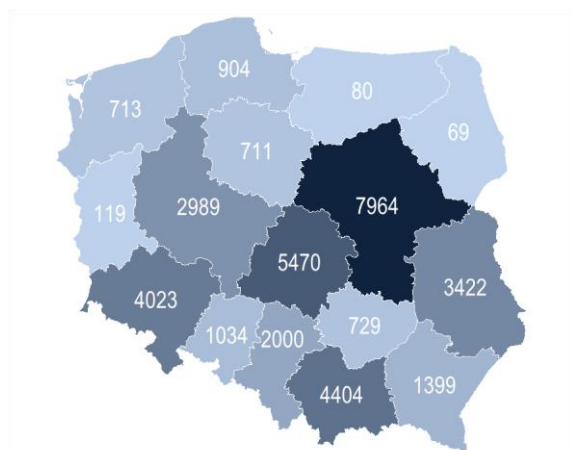

Pomorskie voivodeship. At the other extreme are the Lubuskie (94%) and Dolnośląskie (93%) voivodeships.

6.2. Lubelskie voivodeship - characteristics of migration to the academic centre near the border

According to data from the RAD-on system,¹⁹ Ukrainian citizens remain the most numerous group of foreign students in Poland – their share in the total number of foreign students increased from 42% in 2021 to over 45% in 2024. The number of students from Ukraine increased by 32% nationwide in 2021–2024. Changes in the numbers were diversified depending on the voivodeship. An increase was recorded in 15 of the 16 voivodeships, only in the Łódzkie voivodeship did their number decrease (Figure 82, Figure 83).

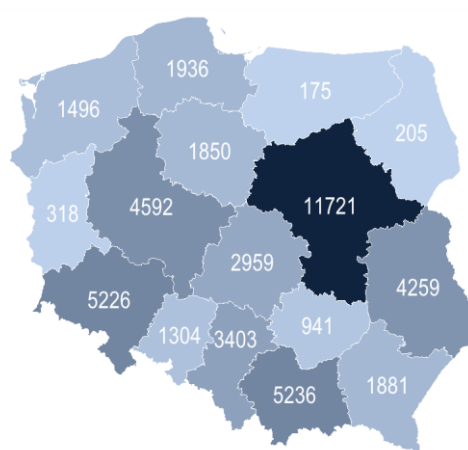

The nationwide increase in the number of students from Ukraine was caused by the outbreak of the full-scale war in 2022 and the associated series of statutory measures facilitating access to tertiary education for citizens of that country, including: waiving tuition fees for full-time studies in Polish at public universities, extended access to means-tested scholarships and financial aid, as well as the possibility of obtaining a student loan.²⁰

Figure 82. Number of students from Ukraine by voivodeship in 2021

Source: Own study based on data from the RAD-on system.

Figure 83. Number of students from Ukraine by voivodeship in 2024.

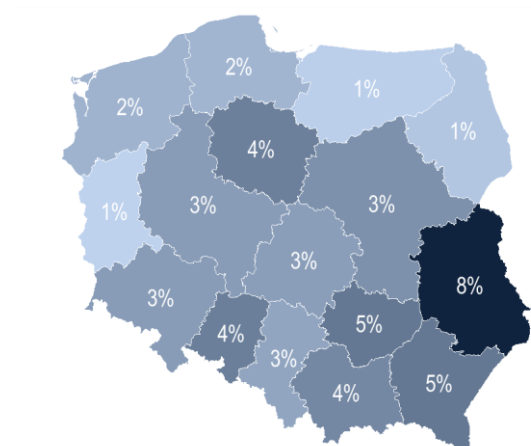

Source: Own study based on data from the RAD-on system.

The share of Ukrainian students in the total number of citizens of this country residing in Poland is relatively small and in most voivodeships ranges between 1% and 5%. The highest share was recorded in the Lubelskie voivodeship (8%).

Figure 84. Share of students from Ukraine in the total number of Ukrainian citizens (based on the data from UKR PESEL and the residence database of the UdSC) by voivodeship²¹

Source: Own study based on the data from the RAD-on system, UKR PESEL register, and the UdSC residence database.

Figure 85. Number of students from Ukraine in the Lubelskie voivodeship by mode of study in 2021-2024

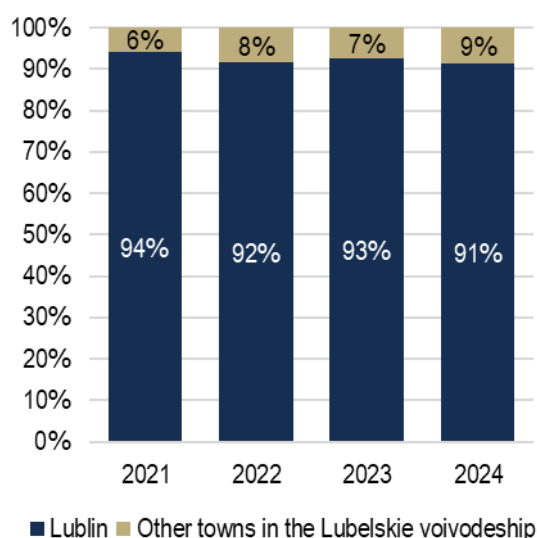

Source: Own study based on data from the RAD-on system.

Ukrainian students in the Lubelskie Voivodeship mainly study full-time, mostly in Lublin, where they can choose from several universities with a varied range of courses.

Most students are male and a marked change in the proportion of students by gender occurred after 2022. This phenomenon can be linked to increased educational migration among young men, who, in the conditions of armed conflict, chose to start or continue studying in Poland in a stable environment.

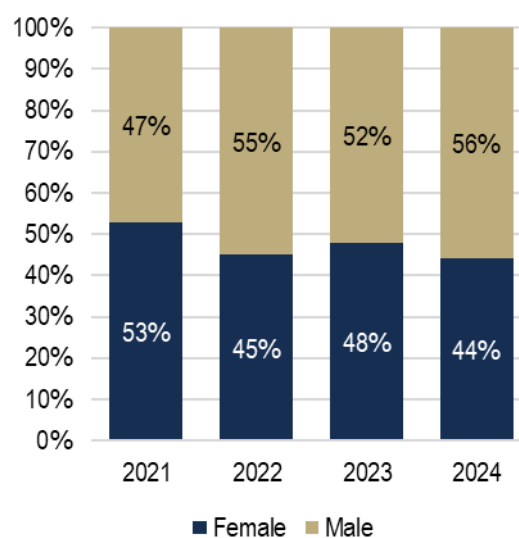

²¹ The share was calculated as the ratio of the number of Ukrainian students to the total number of immigrants in the voivodeships (based on the UKR PESEL register) and the UdSC residence database.

Figure 86. Structure of Ukrainian students by university location

Source: Own study based on data from the RAD-on system.

Figure 87. Structure of Ukrainian students by gender in the Lubelskie voivodeship

Source: Own study based on data from the RAD-on system.

The NBP survey²² of Ukrainian students at Lublin universities shows that the largest group – almost a third of all respondents – consists of individuals coming from the western regions of Ukraine. This result is understandable in the context of proximity of the Lubelskie Voivodeship to the regions of western Ukraine, which facilitates both educational migration and the maintenance of family ties. There is also a significant share of students from the central part of Ukraine (24%). On the other hand, people from the eastern regions make up the smallest group.

More than half of the students surveyed declare their intention to stay in Poland for a longer period of time – more than one year or permanently. The percentage of students planning to settle permanently in Poland (29%) is similar to the percentage of Ukrainian immigrants declaring such an intention in the Lubelskie Voivodeship (27%) and in Poland in general (34%). Clearer differences emerge, however, in the case of plans to stay for more than a year but not permanently – such an intention is declared by 28% of students, compared to only 15% of immigrants in the Lubelskie Voivodeship and Poland as a whole. Such differences may be due

²² The survey was conducted on a sample of 129 students. The same weights were applied to this sample as to the whole population in the survey.

to the fact that some students associate their stay in Poland mainly with their study period , planning later to emigrate further or return to Ukraine.

A small percentage of students indicate that their stay will be shorter than a year, while a significant part of respondents was unable to declare the length of their stay in Poland (40%). In comparison, uncertainty about the length of stay among all immigrants is higher, amounting to 55% in the Lubelskie voivodeship and 49% nationwide. Among students from the Lubelskie Voivodeship who are unable to declare the length of their stay, the potential factors inducing them to stay in Poland long-term would include primarily (Figure 90): a possibility of finding a satisfying job (57%), acquiring additional qualifications (40%) and favourable economic conditions, allowing them to support themselves and their families (38%).

Figure 88. Region of origin of students from Ukraine

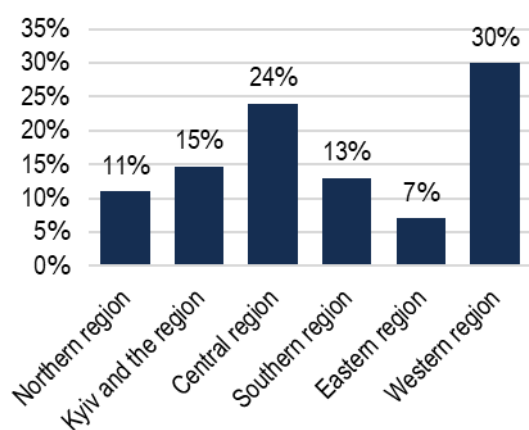

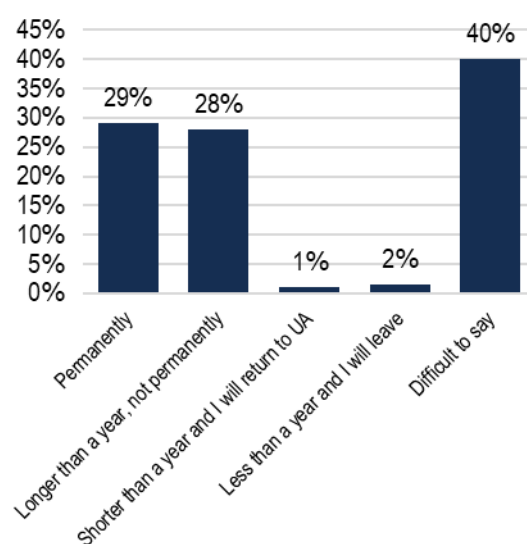

Figure 89. Plans of students from Ukraine concerning their stay in Poland*

The most frequent response to the question about forms of support that would make it easier for Ukrainian students to stay and encourage them to stay in Poland long-term was assistance in finding a job (51%), easier legalisation of their stay (40%), and free training (37%).

Compared to the total number of immigrants staying in the Lubelskie Voivodeship and Poland as a whole, the most important forms of assistance expected by Ukrainian students studying at universities in the Lubelskie Voivodeship are generally similar, but some differences in their importance can be noted. In relation to the total number of immigrants in the Lubelskie voivodeship, students more often (by 15 percentage points) indicate the need for opportunities for unpaid internships and vocational training that would allow them to upskill and make them more competitive on the labour market. At the same time, they are less likely (by 8 percentage points) than the entire group of immigrants in the Lubelskie Voivodeship to expect

financial aid for persons with difficulties in finding employment. On the other hand, compared to the total number of immigrants from all over Poland, students believe that assistance in finding a job is much more important (a difference of 27 percentage points), while they find Polish language courses less important (a difference of 9 percentage points).

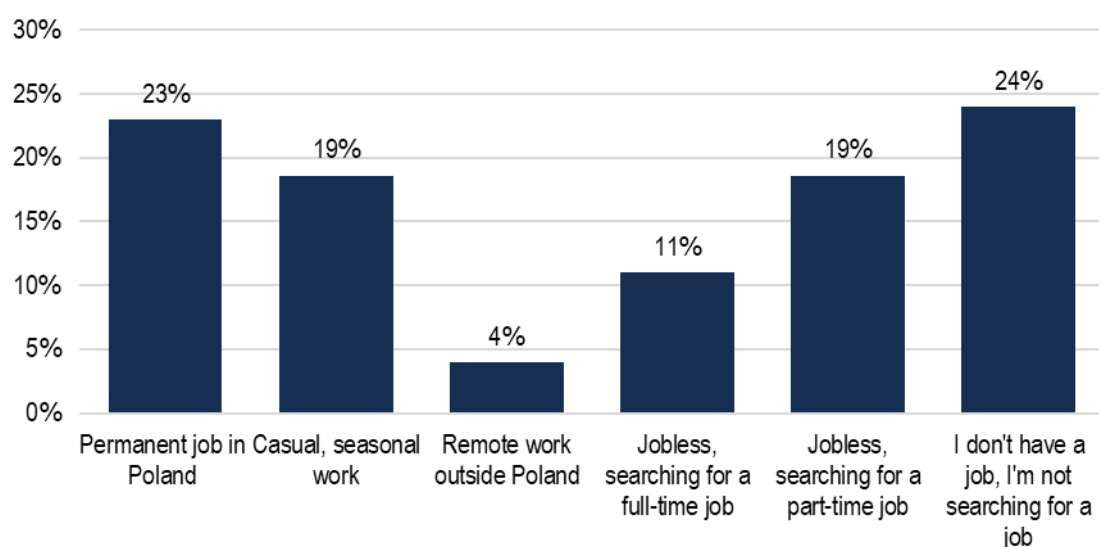

Figure 90. Opinions* concerning the most important forms of assistance that would facilitate the stay of students from Ukraine in the Lubelskie Voivodeship

*Respondents in each survey could select up to three answers. The results do not add up to 100.

The survey showed that 76% of Ukrainian students studying in the Lubelskie Voivodeship are active on the labour market. In this group, almost one in four has a permanent job and nearly one in five has a casual job. A small percentage, only 4% of respondents, perform remote work for entities outside Poland. These results show that work is an important part of students' functioning, but at the same time indicate the need for additional support in finding their way in the local and national labour market, as 73% of students seeking employment and 78% of those in casual employment expect assistance in finding a job (Figure 91).

Figure 91. The labour market situation of students from Ukraine

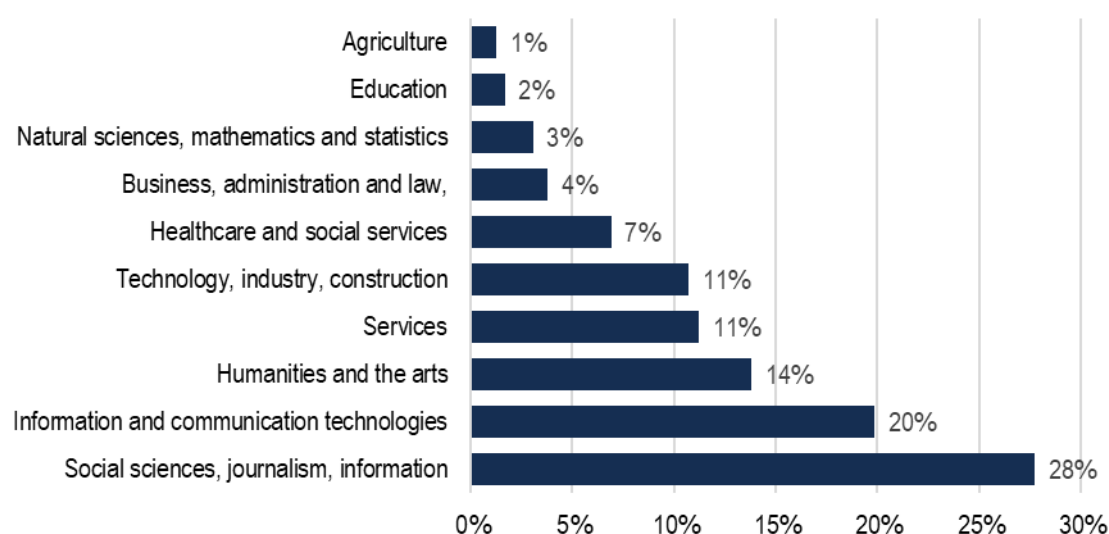

Industry analysis shows that the highest percentage of Ukrainian students is employed in the HoReCa sector (24%), trade (14%) and administration (11%). A good command of the Polish language, which is declared by 89% of the Ukrainian students surveyed, makes it much easier to adapt to the requirements of the labour market.

The analysis of the data obtained from ten universities from the Lubelskie Voivodeship²³ indicates that in 2024, Ukrainian students most often chose fields of study categorised as social sciences, journalism and information (Figure 92).²⁴ There was also a high share of students who were doing courses categorised as ICT (20%).

²³ The source of the data was information obtained directly from universities in the Lubelskie Voivodeship in response to a request for data concerning the fields of study of Ukrainian students. 86% of students from the entire Lubelskie Voivodeship study at these universities.

²⁴ The fields of study were matched according to the ISCED-F 2013 classification.

Figure 92. Fields of study of Ukrainian students in 2024.

Source: Own study based on data from nine universities from the Lubelskie Voivodeship.

The most popular fields of study among Ukrainian citizens in the Lubelskie Voivodeship included IT, chosen by 11% of students in 2024, management (8%) as well as tourism and recreation (6%).

6.3. The Podkarpackie voivodeship - an example of a region with dynamic migration flows

Since 24 February 2022, the migration situation in Poland has been dominated by an increased influx of citizens from Ukraine, who are by far the largest group of foreigners in Poland. For people fleeing from Ukraine, Poland has become the main transit or destination country, and the Podkarpackie Voivodeship, which is a border voivodeship, has supported Ukraine in many ways since the outbreak of the war.

There are nearly 986,770 Ukrainian refugees in Poland registered in the UKR PESEL register. Only 30,641 Ukrainians are staying in the Podkarpackie Voivodeship, despite its border location.²⁵

The highest concentration of immigrants from Ukraine coming to Poland is mainly in the voivodeships with large urban agglomerations. A significantly higher share of immigrants from Ukraine in relation to the population (Figure 5) can be observed in the voivodeships of western

²⁵ UKR PESEL register, June 2025.

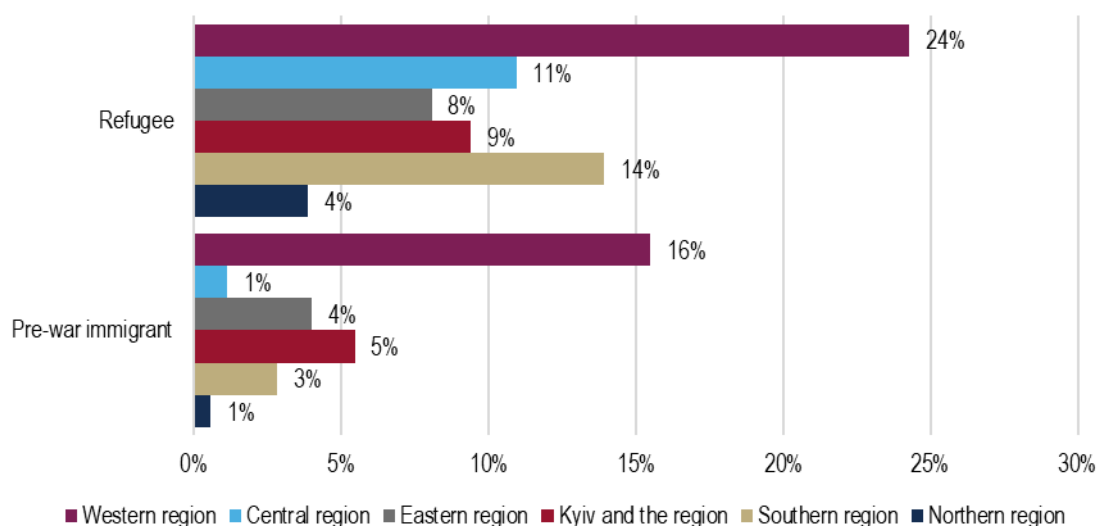

and north-western Poland, while the border voivodeships of eastern Poland demonstrate a significantly lower share of immigrants from Ukraine in relation to the population. This shows that immigrants entering Poland do not necessarily stay in the so-called “first contact” voivodeship. The lowest percentage of Ukrainian immigrants in relation to the population was recorded exactly in the border voivodeships of eastern Poland, i.e.: Podlaskie (1.7%), Warmińsko-Mazurskie (1.8%), Podkarpackie (2%) and Lubelskie (2.6%).

The Podkarpackie voivodeship is an example of a border voivodeship with dynamic migration flows. Although it is a so-called “first contact” voivodeship, only 2% of immigrants in relation to the population have decided to live here.

Respondents from Ukraine living in the Podkarpackie Voivodeship include 30% of people who settled there before the outbreak of the full-scale war, while 70% settled there in connection with the armed conflict.

Before the outbreak of the war, mainly immigrants from the western and central parts of Ukraine (Figure 93) settled in the Podkarpackie Voivodeship. This may be because they wanted to stay relatively close to their home. The outbreak of the war resulted in a greater diversity of regions from which refugees came, but refugees from western Ukraine still represent the largest group in the Podkarpackie Voivodeship.

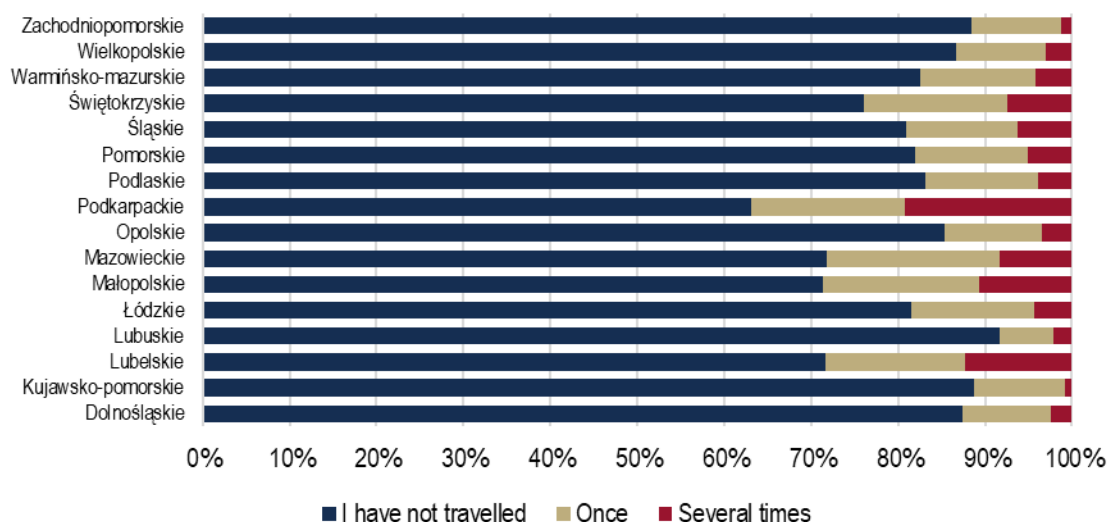

Figure 93. Distribution of pre-war immigrants and refugees from Ukraine in the Podkarpackie voivodeship by region from which they arrived

Proximity to the border, and consequently, an easier contact with relatives who remained in Ukraine, may influence the decision to stay in the Podkarpackie voivodeship. Among

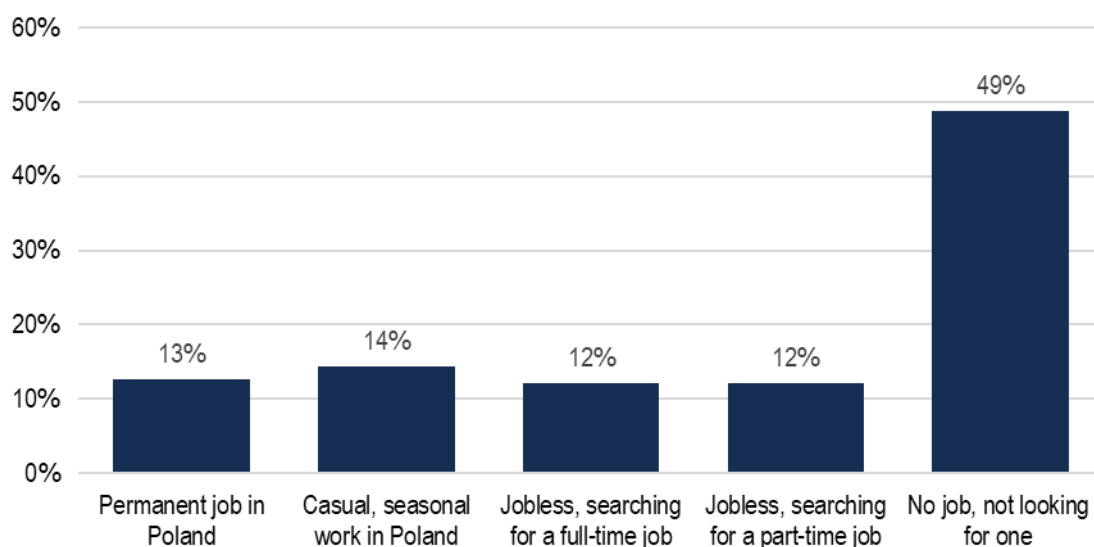

immigrants from Ukraine, the Podkarpackie Voivodeship has the highest percentage of people who have been to Ukraine once or several times this year (Figure 94). They represent 37% of respondents in the Podkarpackie region, compared to the national average of 20%. This region also has the smallest percentage of people who have not been to Ukraine even once this year.

Figure 94. Frequency of immigrants' trips to Ukraine in the first half of 2025 by voivodeship

Housing is one of the factors that determines the quality of life. A high percentage of immigrants staying in Poland (87%) rent a flat, own a flat or have housing provided by their employer. The Podkarpackie voivodeship does not deviate from the national average - here this group of immigrants accounts for 84% (Figure 95). However, what distinguishes the Podkarpackie Voivodeship is the percentage of Ukrainians living with the family or friends from Ukraine. The national average is 4% and in the Podkarpackie Voivodeship it is 11%.

Figure 95. Current situation on the labour market of persons living with their family and friends from Ukraine in the Podkarpackie Voivodeship

In the group of people who live with family or friends from Ukraine in the Podkarpackie Voivodeship, as many as 49% do not have a job and are not searching for one. The reason for this may be that 51% of persons who do not work and are not searching for work from this group receive money from Ukraine in various forms, e.g. in the form of a pension, retirement benefit or salary for work. It is worth noting that the percentage of respondents living in the Podkarpackie voivodeship on a pension received from Ukraine is also higher than the national average of 8% and amounts to 13% for this region.

The 2025 survey was conducted in five age groups, i.e. 18-26 years, 27-34 years, 35-44 years, 45-59 years and 60 years and over. The percentage of respondents in each age group in the Podkarpackie voivodeship is similar to national averages. The exception to this is the age group of 60 and over, which is larger than the national average of 9% and stands at 16% in this region.

Immigrants residing in the Podkarpackie voivodeship make their continued stay in Poland conditional on the conclusion of peace between Ukraine and Russia. This answer was provided by 70% of respondents (nationwide the percentage is 65%). On the other hand, 36% of respondents have not decided about their continued stay, with 8% declaring that after the war ends, they will spend part of the year in Poland and part in Ukraine. This represents a higher percentage than the national average of 5%. The border location of the Podkarpackie Voivodeship may have an impact on the fact that immigrants can plan their lives in both Poland and Ukraine due to the shorter distance from relatives who remained there.

6.4. The Wielkopolskie voivodeship - migration from Ukraine replenishing labour market shortages in Wielkopolska

2025 is another year when Wielkopolska remains the region of Poland with the lowest unemployment rate. According to Statistics Poland data²⁶ of June 2025, the unemployment rate in Wielkopolska was 3.1%, while in the whole of Poland it reached 5.4%. In Poznań, unemployment was once again the lowest in the country, at a level of 1.2%, indicating a stable labour market situation in the city.

At the end of July 2025, there were 97,223 insured persons in the Wielkopolskie voivodeship who declared Ukrainian citizenship in their application for pension and disability insurance.²⁷ On the other hand, it was determined on the basis of registered applications for assigning the UKR PESEL to Ukrainian citizens,²⁸ that approximately 56% of persons registered in the system are at working age, of which 38% are female and 18% are male.

The Local Occupation Barometer developed by the Regional Labour Office in Poznań²⁹ contains a list of 15 shortage occupations in Wielkopolska forecast for 2025.³⁰ According to the report, the highest number of shortage occupations in Wielkopolska is found in sectors related to construction, transport, industry as well as in the medical and care sector. Difficulties in meeting employers' staffing needs in 2025 remain similar to the 2024 forecast (for 4 occupations, the number of districts experiencing a shortage has increased, while in the remaining 11, it has decreased).

The survey conducted by NBP in 2025 shows that in Wielkopolska, 90% of immigrants work, of which 78% are permanently employed, 5.9% have casual jobs and 6.2% are self-employed (Figure 96).

Figure 96. Current labour market situation of immigrants in Wielkopolska

²⁹ Occupation Barometer 2025. Edition X, Summary report of the survey in the Wielkopolskie voivodeship, Regional Labour Office in Poznań.

³⁰ The Occupation Barometer is a qualitative survey conducted once a year. It is developed during expert panels held in individual districts.

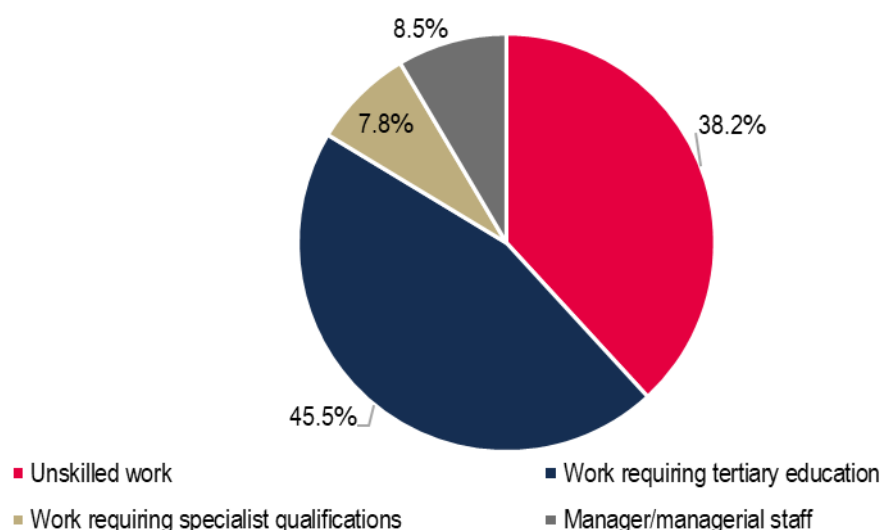

Among the immigrants from Ukraine working in Wielkopolska, 44.9% fill the gaps in occupations from the groups indicated in the Occupation Barometer as shortage occupations:

- 20.7% work in the biggest sector in terms of its constituent occupations (machine tool operators, locksmiths, welders, electricians, electromechanics and electrical fitters),
- 9.7% work in the transport, freight forwarding and logistics industry (lorry and HGV drivers, bus drivers, warehouse keepers),
- 9.7% work in the construction industry (carpenters and joiners, roofers and tinsmiths, fitters of building installations, bricklayers and plasterers, construction workers),
- 3.1% work in household services, including those related to childcare or elderly care,
- 1.6% work in industries related to healthcare and social services.

It is worth noting that in 2025, compared to 2024, staff shortages have also been reduced in the retail industry, where the shortage has decreased by 25% (salespeople account for 21% of working respondents) and in the personal services industry, where the shortage has decreased by 63.6% (e.g. beauticians account for 3.9% of working respondents).

A significant part of the above-mentioned occupations requires appropriate education and specialist qualifications. The survey shows that 43.1% of the immigrants in Wielkopolska included in the analysis have tertiary education and 53.3% have secondary education (including 33.3% with secondary vocational education). For the majority of respondents (57.5%), the work performed in Poland does not differ in terms of qualifications from the work in Ukraine, while for 28.5% the work performed is below their qualifications. 16.4% of respondents are employed in managerial positions or in jobs requiring tertiary education, 45.5% are employed in jobs requiring special qualifications and 38.2% are unskilled workers (Figure 97).

Figure 97. Types of work performed by immigrants in Wielkopolska (by qualifications)

The length of the planned stay in Poland of employed immigrants is an important factor that may affect the extent to which staffing needs are met. The survey showed that 48% of immigrants want to stay in Poland long, of which 37.5% plan to stay permanently and only 3.5% want to stay for less than a year. Respondents identified that the main reasons that could influence their decision to stay in Poland for more than a year include finding a satisfying job (54.4%) and the ability to support themselves and their family (47.2%).

6.5. The Dolnośląskie voivodship - conditions underlying frequent permanent migration

Wrocław is the third most populous city in Poland and the Dolnośląskie voivodship is the fifth most populous voivodeship in Poland. Since 1945, the population of Lower Silesia has consisted mainly of settlers from various other regions of Poland. For many years, the Wrocław conurbation has been striving to attract citizens from other countries to come here, whether to study or to live and work.³¹ There are three Special Economic Zones and one subzone in the Dolnośląskie voivodship, which means, among other things, that the labour market is receptive and it is relatively easy to find employment here.

The largest group of immigrants in the Dolnośląskie voivodship are people coming from Ukraine. Their numbers, according to various data sources, have reached between 100 thousand to 200 thousand people in Wrocław. Approximately 80 thousand are refugees who

³¹ <https://araw.co.uk/study-in-wroclaw-na-zagranranrancy-targets-education>.

arrived in Wrocław after 24 February 2022.³² On the other hand, based on the data on the number of refugees from the UKR PESEL register as at 9 September 2025, the number of registered persons with such a status in Wrocław reached 59,024.³³

The influx of immigrants, especially from Ukraine, has made it necessary for the Wrocław agglomeration to adapt to the new situation. Representatives of the Mayor of Wrocław for persons of Ukrainian and Belarusian origin have been appointed. The official website of the city has also been maintained in the Ukrainian language for years. Various organisations, associations and foundations supporting immigrants and refugees in Wrocław and in Lower Silesia are also of significant importance to Ukrainian citizens staying in the region.

According to a survey conducted in Lower Silesia, 55% of immigrants are female. Immigrants come from all regions of Ukraine, but mostly from central Ukraine (27%). Western Ukraine, which is the most represented region at the national level (25% of total respondents), accounts for 14% of respondents. As in the national survey - persons aged 35-44 account for the largest share of immigrants in the Dolnośląskie voivodeship. More than 43% of them have a university degree. Immigrants who speak Polish well or fluently represent 79% of respondents. Almost half of the respondents are staying in Poland with their husband or wife. Most immigrants rent or own a dwelling. Almost 80% of them have a permanent job and 7% are self-employed.

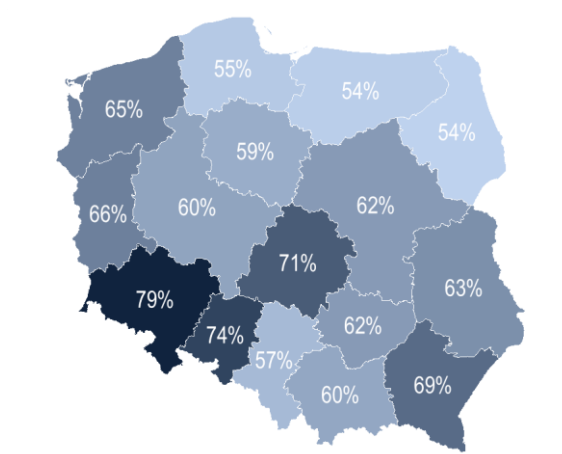

Dolnośląskie is the voivodeship with the highest share of Ukrainian immigrants in Poland in relation to the population (6.2 %), and probably the second highest number of refugees following the Mazowieckie voivodeship. The wave of immigration to Lower Silesia began as early as the first decade of the 21st century. According to the UdSC data, in 2010, 10% of immigrants from Ukraine with valid residence permits in Poland resided in the Dolnośląskie voivodeship.³⁴ In 2025, the number has already reached 14%. Considering immigration in the region, it is important to note that it bears the hallmarks of permanent rather than just the economic immigration. The veracity of this thesis can be evidenced by the percentage of immigrants who speak Polish well or fluently, which is the highest in Poland at a level of 79% against the national average of 64% (Figure 98).

Figure 98. Percentage of immigrants who speak Polish well or fluently by voivodeship

³² <https://www.portalsamorzadowy.pl/polityka-i-spoleczenstwo/mniejszosc-ukrainska-we-wroclawiu-moze-liczyc-180-tys-osob,525739.html?mp=promo>

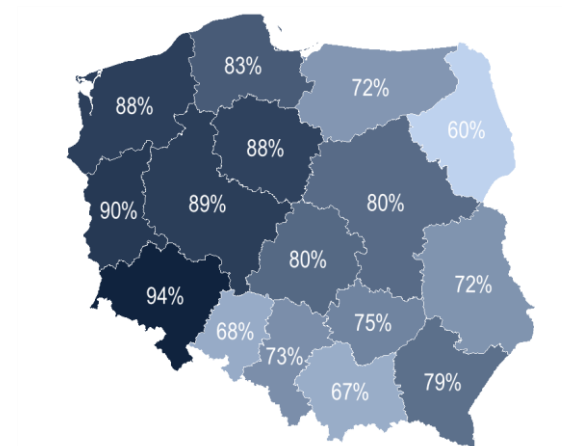

³³ <https://dane.gov.pl/pl/dataset/2715,zarejestrowane-wnioski-o-nadanie-statusu-ukr/resource/79621/table>.

³⁴ Migracje.gov.pl – UdSC, Maps and Statistics of immigration and migration services in Poland. Residence permits do not include visas.

A stable housing situation is conducive to making plans for the future. In terms of the share of respondents renting or owning a dwelling, this is as high as 94% among immigrants in the Dolnośląskie voivodeship compared to the national average of 81% (Figure 99). A total of 9% of respondents in this voivodeship said that they owned a dwelling. It can be assumed that people who buy dwellings plan to tie their future to Poland.

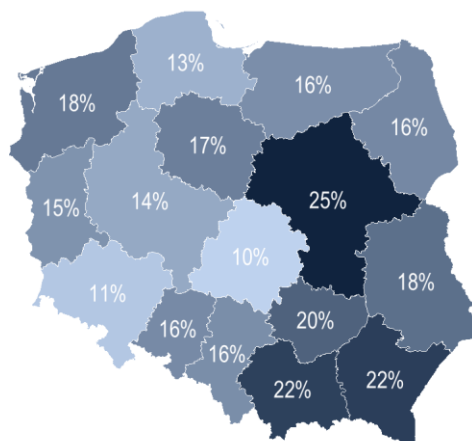

Figure 99. Share of respondents renting or owning a dwelling in Poland by voivodeship

In the Dolnośląskie voivodeship, 44% of immigrants declare their intention to stay in Poland permanently. Only 11% of immigrants in the Dolnośląskie voivodeship who have specific plans for the future (i.e. excluding those answering “difficult to say”) declare that they will not stay permanently (Figure 100). This figure is 6 percentage points lower than the national average.

The share of immigrants who declare that they will return to Ukraine if the war ends is 5% in the Dolnośląskie voivodeship and it is the lowest in the country (the average for Poland is 11%). It can therefore be concluded that, irrespective of the further developments in the war, to a certain extent, immigration in Lower Silesia is permanent.

Figure 100. Share of respondents planning to leave Poland (answers “I will stay longer than a year, but not permanently,” “I will go to Ukraine or another country”) by voivodeship

Annex 1. Description of the survey method

The survey among immigrants from Ukraine was conducted between 7 April 2025 and 20 June 2025 by the Regional Branches of Narodowy Bank Polski in all voivodeships. The survey was carried out using the PAPI method (paper questionnaires completed by respondents) with the use of a questionnaire prepared in Belarusian, Russian and Polish.

The survey focused on adult immigrants from Ukraine (persons aged 18 and over), both pre-war immigrants and refugees. Due to the need to obtain a minimum size of each migrant group for the analyses, it was assumed that the proportion of people in each group should be no less than 30% of the sample size provided for each NBP Regional Branch. It was assumed that refugees are persons registered in the PESEL-UKR register or unregistered but who arrived in Poland for the first time for purposes other than tourism no earlier than 2022. Other persons were regarded pre-war immigrants.

In order to make sure that the survey was well attended, the questionnaires were collected in 16 voivodeship capital cities of Poland, as well as in towns outside the capital city (34% of the sample taken). In addition, it was assumed that respondents in each of the voivodeships would be recruited in at least four categories of places out of a list of eight such categories (e.g. companies, offices, immigrant organisations, collective accommodation facilities, universities). It was assumed that the percentage of respondents at each site should not exceed 30%. In addition, it was assumed that when selecting participants in the survey, it was important to avoid selecting too many people at the same location (e.g. one person per family, no more than five people working in the same company). A total of 3,965 questionnaires were collected.

In order to improve the representativeness of the survey, the results were weighted by the proportions of the UKR PESEL and the UdSC database of current residence permits by voivodeship and gender.

The survey was carried out by employees of NBP Regional Branches. The survey was conducted owing to the cooperation of various institutions, including Polish authorities, companies and social organisations helping to recruit respondents.

Annex 2. Research tool - the survey questionnaire (Polish version)

PL-Numer Kwestionariusza:

Dzień dobry! Uczestniczy Pan/Pani w ankiecie dotyczącej warunków pracy i pobytu migrantów i uchodźców z Ukrainy w Polsce prowadzonej przez Narodowy Bank Polski – Bank Centralny Polski, emitujący polską walutę. Informacje z poniższych pytań są bardzo ważne dla prawidłowej realizacji naszych państwowych zadań. Uzyskane informacje pozwolą także lepiej zorientować się z jakimi problemami mają do czynienia obywatele Ukrainy w Polsce oraz zaproponować rozwiązania służące ich potrzebom. Informacje uzyskane od Pana/Pani są anonimowe i będą wykorzystywane jedynie do celów statystycznych zgodnie z polskim prawem. Nie prosimy Pana/Pani o podanie imienia i nazwiska ani o okazanie żadnych dokumentów tożsamości!

Instrukcja wypełnienia ankiety:

Proszę o udzielenie odpowiedzi poprzez wstawienie znaku X przy właściwej odpowiedzi według przykładu:

☒ ☐

P1. Czy jest Pan/Pani obywatelem Ukrainy?	☐ 1. Tak	☐ 2. Nie → Koniec ankiety
P2. Płeć respondenta	☐ 1. Mężczyzna	☐ 2. Kobieta
P3. Ile ma Pan/Pani lat?	☐ 1. Od 18-26	☐ 2. Od 27-34
	☐ 3. Od 35-44	☐ 4. Od 45-59
	☐ 5. 60 i więcej	
P4. Jak jest Pana/Pani wykształcenie?	☐ 1. Wyższe	☐ 2. Średnie ogólnokształcące
	☐ 3. Średnie zawodowe	☐ 4. Podstawowe, zawodowe
P5. Kiedy rozpoczął się Pana/Pani obecny* pobyt w Polsce?	Rok __ _ _ _ _ i jeżeli pamięta Pan/Pani - Miesiąc __ _ _	
	*Przez obecny pobyt rozumiemy pozostawanie w Polsce bez przerw dłuższych niż 1 miesiąc	
P6. Czy posiada Pan/Pani numer PESEL?	☐ 1. Nie	☐ 2. Tak, otrzymałem/am go rejestrując się po 24.02.2022
	☐ 3. Tak, otrzymałem/am go przed 24.02.2022	
P7. Z jakiego regionu Ukrainy Pan/Pani pochodzi? (mieszkał przed wybuchem wojny)	☐ 1. północny (obwody: sumski, żytomierski, czernihowski) ☐ 2. Kijów i obwód kijowski ☐ 3. centralny (obwody: dniepropetrowski, połtawski, czerkaski, winnicki, kirowohradzki) ☐ 4. południowy (obwody: odeski, mikołajowski, chersoński, zaporoski, krymski) ☐ 5. wschodni (obwody: charkowski, ługański, doniecki) ☐ 6. zachodni (obwody: wołyński, rówieński, łwowski, chmielnicki, iwanofrankowski, tarnopolski, zakarpacki, czerniowiecki)	
P8. Czy zna Pan/Pani język polski?	☐ 1. Nie znam	☐ 2. Trochę rozumiem
	☐ 3. Dobrze znam (bez problemu się porozumiewam)	☐ 4. Posługuję się nim biegle w mowie i w piśmie
P9. Czy w tym roku (2025) był(a) Pan/Pani chociaż raz w Ukrainie?	☐ 1. Nie	☐ 3. Tak, byłem(am) kilka razy
	☐ 2. Tak, byłem(am) raz	
P10. W którym roku przyjechał(a) Pan/Pani do Polski po raz pierwszy*?	Rok __ _ _ _ _	
	* chodzi o cel inny niż turystyczno-wypoczynkowy	
P11. Które z wymienionych osób przebywają z Panem/Panią w Polsce (Można wybrać więcej niż jedną odpowiedź).	☐ 1. Nikt	☐ 4. Dzieci cudze w wieku poniżej 18 lat (pod opieką Pana/Pani) Liczba dzieci...
	☐ 2. Mąż/żona/partner/partnerka	☐ 5. Inni członkowie rodziny (np. dorosłe dzieci, rodzice, rodzeństwo, wnuki)
	☐ 3. Dzieci własne w wieku poniżej 18 lat. Liczba dzieci?....	
P12. Co stanowi największą trudność dla przebywających z Panem/ Panią dzieci w Polsce? (Można wybrać 3 odpowiedzi)	☐ 1. Nie dotyczy	☐ 6. Pogorszenie poziomu życia w porównaniu do sytuacji w Ukrainie
	☐ 2. Brak znajomości języka polskiego	☐ 7. Konieczność przejęcia obowiązków dorosłych
	☐ 3. Inny program nauczania w szkole	☐ 8. Nie ma trudności
	☐ 4. Brak znajomych	☐ 9. Inne. Jakże:
	☐ 5. Niedobre nastawienie innych dzieci w szkole	

P13. Jaka jest Pana/Pani obecna sytuacja mieszkaniowa w Polsce?	☐ 1. Wynajmuję mieszkanie lub pokój ☐ 2. Mam własne mieszkanie/dom ☐ 3. Pracodawca zapewnia mi mieszkanie ☐ 4. Mieszkam u rodziny lub znajomych z Ukrainy	☐ 5. Mieszkam u polskiej rodziny ☐ 6. Mieszkam w miejscu zorganizowanego zakwaterowania uchodźców (np.: hotel, zajazd, hostel, itp.) ☐ 7. Inne miejsce niż wymienione powyżej
P14. Jak długo Pana/Pani zdaniem będzie jeszcze trwał obecny* Pana/Pani pobyt w Polsce?	*obecny pobyt to pozostawanie w Polsce bez przerw dłuższych niż jeden miesiąc ☐ 1. Zostanę na stałe w Polsce ☐ 2. Dłużej niż rok, ale nie na stałe ☐ 3. Krócej niż rok i wracam do Ukrainy ☐ 4. Krócej niż rok i wyjeżdżam do innego kraju niż Ukraina ☐ 5. Trudno powiedzieć	
P15. Jakie czynniki mają lub mogą mieć wpływ na to, że pozostanie Pan/Pani w Polsce powyżej roku (maksymalnie 2 odpowiedzi)	☐ 1. Znalezienie satysfakcjonującej pracy ☐ 2. Przyjazd do Polski członków rodziny, którzy obecnie są w Ukrainie ☐ 3. Opinia dzieci (czy zaaklimatyzują się w Polsce) ☐ 4. Możliwość utrzymania siebie i rodziny	☐ 5. Znalezienie odpowiedniego mieszkania ☐ 6. Uzyskanie dodatkowych kwalifikacji zawodowych ☐ 7. Inne, jakie ☐ 8. Nie rozważam pozostania w Polsce powyżej roku
P16. Jaka jest Pana/Pani aktualna sytuacja na rynku pracy w Polsce? Proszę wybrać najlepiej pasującą odpowiedź.	☐ 1. Pracuję na stałe w Polsce (jako pracownik) ☐ 2. Praca dorywcza, sezonowa lub inna praca w Polsce ☐ 3. Własna działalność gospodarcza w Polsce (także jednoosobowa) ☐ 4. Praca zdalna dla firmy z siedzibą za granicą, w tym w Ukrainie. Proszę podać kraj ☐ 5. Pozostaję bez pracy, ale poszukuję pracy na cały etat i mogę ją podjąć od zaraz → Proszę przejść do pytania nr P23 ☐ 6. Pozostaję bez pracy, ale poszukuję pracy na część etatu i mogę ją podjąć od zaraz → Proszę przejść do pytania nr P23 ☐ 7. Nie mam pracy, nie poszukuję → Proszę przejść do pytania nr P23	
P17. W jakich branżach pracuje Pan/Pani aktualnie? (można zaznaczyć więcej niż jedną odpowiedź)	☐ 1. Administracja (praca biurowa) ☐ 2. Rolnictwo, ogrodnictwo ☐ 3. Przemysł (np. w fabryce, hucie) ☐ 4. Transport ☐ 5. Budownictwo ☐ 6. Handel (sklepy, hurtownie, magazyny) ☐ 7. Hotele i restauracje (gastronomia) ☐ 8. Usługi osobiste (np. fryzjer, kosmetyczka) ☐ 9. Ochrona zdrowia i opieka społeczna ☐ 10. Usługi na rzecz gospodarstw domowych - np. płatna opieka nad dziećmi lub osobami starszymi, sprzątanie ☐ 11. Edukacja, kultura ☐ 12. Informatyka, telekomunikacja ☐ 13. Finanse, bankowość, marketing, konsulting, usługi prawne ☐ 14. Inne	
P18. Jak duża jest orientacyjnie firma, w której pracuje Pan/Pani aktualnie?	☐ 1. Nie większa niż 9 pracowników ☐ 2. Powyżej 9 pracowników	☐ 3. Nie wiem
P19. Jakiego rodzaju pracę wykonuje Pan/Pani aktualnie? (proszę wybrać najbardziej pasującą odpowiedź)	☐ 1. Prace proste ☐ 2. Prace wymagające kwalifikacji specjalistycznych, ale niewymagające wyższego wykształcenia	☐ 3. Prace wymagające wyższego wykształcenia ☐ 4. Menedżer/Kadra kierownicza
P20. Czy praca jaką wykonuje Pan/Pani w Polsce różni się od pracy w Ukrainie pod względem wymaganych kwalifikacji?	☐ 1. Nie różni się od pracy na Ukrainie ☐ 2. Tak, jest poniżej moich kwalifikacji (zawodu, który wykonywałem/am na Ukrainie)	☐ 3. Tak, jest inna niż moja praca na Ukrainie, ale nie jest poniżej moich kwalifikacji ☐ 4. Nie pracowałem/am na Ukrainie
P21. Ile przeciętnie godzin tygodniowo pracuje Pan/Pani w Polsce?	____ ____ godzin w tygodniu, biorąc pod uwagę wszystkie wykonywane prace	
P22. Jaki jest w łącznie Pana/Pani średnie miesięczne wynagrodzenie na rękę (netto) za pracę w Polsce w złotych* ?	*Proszę uwzględnić zarobki z wszystkich prac w Polsce ☐ 1. do 2000 zł ☐ 2. 2001 - 3000 zł ☐ 3. 3001 - 4000 zł ☐ 4. 4001 - 5000 zł ☐ 5. 5001 - 6000 zł ☐ 6. 6001 - 7000 zł ☐ 7. 7001 - 8000 zł ☐ 8. powyżej 8000 zł	

P23. Czy otrzymuje Pan/Pani lub członek Pana/Pani najbliższej rodziny polskie świadczenia społeczne?	Proszę zaznaczyć wszystkie pasujące odpowiedzi dotyczące typów świadczeń. Jeśli nie odpowiedź „Nie, nie otrzymuję”:																												
	☐ 1. Zasiłek dla bezrobotnych ☐ 2. Program 800+ ☐ 3. Inne zasiłki i świadczenia związane z wychowaniem dzieci ☐ 4. Zasiłki socjalne (związane z sytuacją materialną) :	☐ 5. Świadczenia emerytalne/rentowe ☐ 6. Stypendium ☐ 7. Inne, pieniądze (jakie?) ☐ 8. Nie, nie otrzymuję																											
P24. Czy będąc w Polsce otrzymuje Pan/Pani środki finansowe z Ukrainy? (można zaznaczyć więcej niż jedną odpowiedź)	☐ 1. Nie, nie otrzymuję → Proszę przejść do pytania 26 ☐ 2. Tak, otrzymuję emeryturę lub rentę ☐ 3. Tak otrzymuję wynagrodzenie za pracę ☐ 4. Tak, otrzymuję inne świadczenia z Ukrainy	☐ 5. Tak, otrzymuję pomoc finansową od rodziny ☐ 6. Tak, korzystam ze środków zgromadzonych na koncie w ukraińskim banku																											
P25. Proszę oszacować łączną wysokość środków finansowych otrzymywanych z Ukrainy średnio miesięcznie.	☐ 1. Do 500 zł ☐ 2. Od 501 - 1000 zł ☐ 3. Od 1001 - 2000 zł	☐ 4. Od 2001 - 3000 zł ☐ 5. Od 3001 - 4000 zł ☐ 6. Od 4001 - 6000 zł ☐ 7. Powyżej 6000 zł miesięcznie																											
P26. Jaką część średniego miesięcznego wynagrodzenia na rękę (netto) z pracy w Polsce stanowią Pana/Pani wydatki „na życie” w Polsce (zakwaterowanie, stałe opłaty, wyżywienie)?	☐ 1. Wydaję miesięcznie: <table border="1" data-bbox="710 896 1260 1030" style="margin-left: 100px;"> <tr> <td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td> </tr> <tr> <td>☐</td><td>☐</td><td>☐</td><td>☐</td><td>☐</td><td>☐</td><td>☐</td><td>☐</td><td>☐</td> </tr> <tr> <td>0% - 20%</td><td>21% - 30%</td><td>31% - 40%</td><td>41% - 50%</td><td>51% - 60%</td><td>61% - 70%</td><td>71% - 80%</td><td>81% - 90%</td><td>91% - 100%</td> </tr> </table> ☐ 2.
